Abstract

The main objective of this study was to determine the influence of time management tendencies on the relationship between employee empowerment and organizational performance. Preference-driven variations in the temporal pattern of employees' activities affect their strategic decision processes and, consequently firm performance. It is potentially beneficial to understand the differences in workplace attitudes and behaviors which affect use of time so that the "right" mix of individuals may be hired to fit an organization's situation. The present study was informed by Attention-based theory and the theory of reasoned action. This was a survey of the University of Nairobi. Proportionate stratified random sampling technique was used for the selection of respondents for the study. Service quality, rate of innovation and employee satisfaction were used measure to organizational performance. The results showed that efforts that University management has made to empower employees have not been successful. Organizational empowerment practices that have a significant impact on time management tendencies were found to be management's commitment to organizational feedback, management's emphasis on a congenial and friendly atmosphere, its emphasis on greater cooperation, teamwork, and support, and a free and open communication environment. There was negative relationship between the rate of innovation and employees being forced to complete their work within time allocated. Monochronic tendencies were positively and significantly correlated with organizational performance while the polychronic orientation had positive significant correlation with customer satisfaction.

INTRODUCTION

Traditionally, management theory and principles have been largely prescriptive. This was based on the assumption that there are best practices that are effective in every situation. This one-size-fits-all approach to management that was applied from the time of Taylor in the early 20th century when strict division of labour and specialization was emphasized is no longer an appropriate strategy for ensuring maximum employee performance (Riccucci, 2002). Today, multitasking has become an important component of job performance for many workers. In fact some scholars have asserted that almost every job requires at least some degree of multitasking (Buhner, Konig, Pick, & Krumm, 2006). As a result of expanding global competition and increased demands for immediate availability of products and services, the temporal dimension of work has become more important (Orlikowsky and Yates, 2002). Preference-driven variations in the temporal pattern of employees' activities affect their strategic decision processes and, consequently firm performance. Time is central to human functioning; therefore, proper scheduling of time and its appropriate allocation to various competing tasks is an important part of organizational management (Benabou, 1999). More importantly, time is a vital strategic element and a competitive advantage. Time management is the art of arranging, organizing, scheduling, and budgeting one's time for the purpose of generating more effective work and productivity.

Early time management methods and techniques have been criticized for not considering the different systems of time, which may characterize specific workplaces. However, not much work in strategic leadership has expanded and refined ideas from early seminal studies that observed top managers' temporal pattern of activities (Finkelstein, Hambrick and Canella, 2009) referred as monochronic and polychromic work styles or time management. These styles refer to single tasking and multitasking, respectively. Monochronic and polychronic styles are likely to be different in their effectiveness in various work situations. It is potentially beneficial to understand the differences in workplace attitudes and behaviors which affect use of time so that the "right" mix of individuals may be hired to fit an organization's situation. Such understanding may allow mutual appreciation of both styles and create higher potential for harmony within an organization.

Organizational and individual behavior variables are significant to a company's overall performance (Piercy, Cravens, Lane, Vorhies, 2006). In contemporary management literature and practices, for example, empowerment in the workplace is manifestly important because of its influence on organizational outcomes (Laschinger, Finegan, Shamian & Wilk, 2004). Ugboro and Obeng (2001)

argued that in organizations, empowerment is achieved by encouraging employees to respond to work related problems and giving them the resources and authority to do so. Empowerment provides major benefits to the selling firm by enabling quicker on-the-spot responses to customer needs during service delivery, faster on-line responses to rectify dissatisfying situations and by driving employees to interact with customers more professionally, confidently, warmly and enthusiastically (Bowen and Lwaler, 1992). These benefits can lead to improved organizational productivity and increase in customer satisfaction (Houlihan, 2007).

The Kenyan public universities are facing multiple challenges: heightened competition, surging number of students in the face of declining funding from the public purse, insufficient remuneration for academic and other members of staff, complex environmental influences and persistent adverse economic impacts that continue to create constant change as well as multifaceted consequences of globalizations (Mok, 2003). Consequently, the universities are forced to do more with less and work smarter to respond effectively to the cited challenges and the increased demands for immediate availability of products and services. The University of Nairobi (UON), a body corporate established by an Act of Parliament (Cap 210) of the Laws of Kenya is the pioneer institution providing University education in Kenya and the region. It is the oldest and largest university in Kenya. Although its history as an educational institution goes back to 1956, it did not become an independent university until 1970 when the University of East Africa was split into three independent universities: Makerere University in Uganda, the University of Dar es Salaam in Tanzania, and the University of Nairobi. The UON has six colleges namely: Agriculture and Veterinary Sciences, Architecture and Engineering, Biological and Physical Sciences, Education and External Studies, Health Sciences and Humanities and Social Sciences. The University of Nairobi, like its counterparts in the region, is facing stiff competition, declining funding from the exchequer and rising expectations from its stakeholders. These changes present challenges to the institution that can only be addressed effectively by working smart. Among other things, the University's service charter demands rapid response by its service providers to the consumers of its service. For this to happen, University's service providers need to engage in multitasking. The extent to which this is done was the subject of this study.

Research Objective

The main objective of this study is to determine the influence of time management tendencies on the relationship between employee empowerment and organizational performance.

THEORITICAL BACKGROUND

The process of theory building is a process of identifying patterns of relationships among factors. Temporal orientation is the way time is viewed by an individual. Time is a construction that people make in relation to one another through their interaction (Lauer, 1981); in other words time is a social construction. The present study is based on two theories that is Attention-based theory and the theory of reasoned action.

The attention-based theory views the environment as a source of constant input and stimulus for the organization, but posits that individuals and organizations have limited cognitive capabilities to deal with all available stimuli (March & Simon, 1985). At the level of individuals, attention encompasses the noticing and focusing of time and effort on both the environmental stimuli requiring action and available repertoire of responses which define that action (Ocasio, 1997). At the industry-level attention highlights how industry participants, in their communications and interactions with other industry participants, selectively focus their action on a limited set of issues, situations, and activities that represent potential problems or opportunities for the industry (Hoffman & Ocasio, 2001). A critical principle of attentionbased theories is the principle of selective attention (Ocasio, 2001) which suggests that individuals, organizations, and industries will selectively attend to some external events while ignoring others. The second principle is that of situation cognition (Ocasio, 1997) which posits that the attention of industry participants to particular issues and answers is situated within the particular channels of communication through which they interact. The third principle is that of the structural determination of attention. This suggests that how people think and how they attend to an event is a social and cultural process, shaped by the group, organization, industry, and organizational field (Ocasio, 1997). The attention-based view posits that organizational choices depend on what issues and answers decision makers focus their attention on (Ocasio and Joseph, 2005). The attention-based view expands the set of "attention structure" (Ocasio, 1997:195) namely determinants of what decision makers focus their attention on. Polychronicity/ monochronicity are "attention structure" that guide attention and strategic choice. The study is build on the attention-based view to base moderate how polychronicity/ monochronicity (attention structures) affect decision making channels and processes and subsequently firm performance.

The theory of reasoned action provides a useful framework for analyzing questions about an individual's polychronicity. The theory is applicable in a number of ways: the effects of available time, formal education, fatigue and time of the day on an individual's polychronicity (Slocombe, 1999). The theory

asserts that individuals consider the consequences of acting monochronically or polychronically. Therefore, as the time for task completion is reduced, the individual would consider the priority of each task waiting to be completed, the likelihood of completing the different combinations of tasks in the remaining time, the consequences of completing different combinations of tasks, the inherent pleasure or discomfort in performing each combination of tasks, and the opinions of relevant others. The conditions of these variables would need to be specified in order to appropriately predict the effect of reducing the time available for task completion, (Slocombe, 1999).

The theory of reasoned action may be useful for considering questions such as whether fatigue is likely to affect an individual's polychronically and whether an individual is more polychronic in the morning than in the afternoon or evening. The theory suggests that the individual's energy level, the norms in the work unit and the priorities assigned to the tasks to be accomplished are relevant. The theory of reasoned action suggests that simple questions about polychronicity may have complex answers. The decision to operate monochronically or polychronically may involve choice between placing a higher priority on human relationships or on task accomplishment. This consideration is clearly connected with the subjective norm (one's beliefs about others' opinion and one's motivation to conform to them) in the theory of reasoned action.

TIME MANAGEMENT TENDENCIES

Hall (1983) developed the concepts of monochronic and polychronic time. People who prefer to complete one task before becoming involved with another task are said to have a monochronic orientation, whereas people who prefer to be involved with several tasks at once have a polychronic orientation. Because these orientations are the ends of a continuum, many intermediate preferences exist as well (Bluedorn, Kaufman and Lane. 1992).

Organizational Performance

Performance is a result or set of results that represent productivity and competence related to an established objective, goal or standard. Organizational performance is measured as a composite index comprised of five partial measures: service quality, level of productivity, profitability product to market time and rate of innovation, absenteeism and turnover.

Job performance has become one of the significant indicators used in measuring organizational performance in many studies (Wall, Michie, Patterson, Wood, Sheehan, Clegg and West, 2004). Performance is oftentimes determined by financial figures, but can also be measured through the combination of expected behavior and task-related aspects (Motowidlo, 2003). Performance that is based on an absolute value or relative judgment may reflect overall organizational performance (Gomez-Mejia, Balkin and Cardy, 2007). Job performance is a multi-dimensional construct. Two aspects of performance-related behaviors that are increasingly important in today's work organization are proactive behavior and creativity (Griffin, Neal and Parker, 2007). Researchers have argued that daily variations in performance levels are 'substantial and meaningful' (Beal, Weiss, Barros and MacDermid, 2005-P.1055). Some predictors of performance-related behaviors on a daily basis (Amabile, Barsade, Mueller & Staw, 2005; Fritz & Sonnentug, 2009; Fisher & Noble, 2004; Ohly & Fritz, 2010).

Service quality plays an essential role in the business world. in customer satisfaction, customer retention, customer loyalty and profits (Schneider & Bowen, 1993). The service-profit chain also connects internal service quality with employee satisfaction and loyalty and customer satisfaction and loyalty with organizational growth and profits (Heskitt, Jones, Loveman, Sasser & Schelesinger, 1994). Ayres (1999) pointed out that the level of internal customer service quality has an essential impact on the service vale provided to the external customer. This realization has made may organizations focus on building truly good internal service quality to help increase their overall organizational results.

Human preferences for different patterns of time utilization have potentially important implications for effective workplace behavior (Bluedorn, Kaufman and Lane, 1992; Kaufman, Lane and Lindquist, 1991). Greater insight into the significance of the congruence between individuals' preferred patterns of time utilization and those preferred by their managers and co-workers should help managers understand and influence behavior in their organizations. It should also facilitate the assignment of employees to positions where they will be more successful.

Employee empowerment

Employee empowerment is an absolute business essential today. Employee empowerment gives the company happier employees, who feel important! The delegated choice and participation and subsequently responsibility makes the employees feel like first hand representatives of the business. Employee empowerment can only work if the management team believes in it. The management could

pre-determine and define the scope of decisions made and work towards effectively building decision-making teams (Borade, 2010). Borade (2010) adds that the implementation of employee empowerment requires managers willing to give up control in certain areas of work production. The system must have scope for improvement of the strategy and flexibility within teams. The ability of the employees to contribute to a choice and direct decisions leads to an alleviated feeling of self-worth and dedication. It is very essential to ensure that the employee suggestions are addressed and discussed, especially if the management sees potential in employees. Employee empowerment means job enhancement via decision making. The traditional bureaucracy and the age old emphasis on control and standardization are now things of the past. The new vistas involve innovation, flexibility and commitment and consistent improvement (Borade 2010).

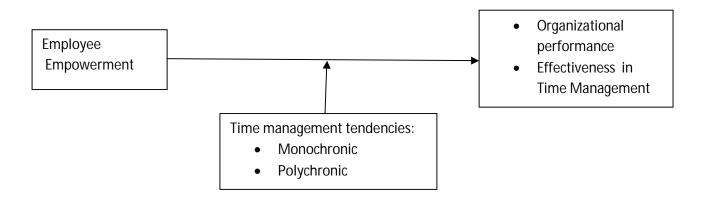

It is widely accepted that empowerment benefits the organizations which implement it effectively. Kanter posits that, "Organizational power can grow, in part, by being shared. . . . By empowering others, a leader does not decrease his power; instead he may increase it--especially if the whole organization performs better" (Kanter, 1979, p. 73). Kanter then uses the logic that, "The productive capacity of nations, like organizations, grows if the skill base is upgraded. People with the tools, information and support to make more informed decisions and act more quickly can often accomplish more." (Kanter, 1979, p. 73).

Many scholars have cited, "anecdotal and case evidence...to show that empowerment does produce more satisfied customers and employees" (Bowen & Lawler, 1995, p.75). However Bowen and Lawler go beyond this and provide additional evidence that "considerable research on practices such as gain sharing, communication programs, work teams, job enrichment, skill-based pay, and so on has shown the results of these practices are consistent and positive" (p.75). Bowen and Lawler (1992) indicate empowered employees provide "quicker on-line response to customer needs during service delivery . . . quicker on-line responses to dissatisfied customers during service recovery . . . employees feel better about their jobs and themselves; . . . employees will interact with customers with more warmth and enthusiasm. . . . when employees felt that management was looking after their needs, they took better care of the customer; . . . great word-of-mouth advertising and customer retention" (pp. 33-34). Randolph (1995) indicates that "A more subtle, yet very powerful benefit" of employee empowerment was increased "trust in the organization" (p. 22). When employees are confident that the company is not out to suck their blood but is providing a competitive produce or service they will respond positively.

That is, "people who have information about current performance levels will set challenging goals--and when they achieve those goals they will reset the goals at a higher level" (Randolph, 1995, p. 23).

CONCEPTUAL FRAMEWORK

Fig. 1: A model of the Relationship between Employee Empowerment, Organizational Performance and Time Management Tendencies

RESEARCH METHODOLOGY

This was a survey of the University of Nairobi. The proposed design falls within the logical positivist paradigm. The target population for this study comprised of all members of staff of the University of Nairobi. The sample comprised of randomly selected university staff members from the six colleges of the University of Nairobi that is at least 35 teaching and 35 non-teaching staff members. Proportionate stratified random sampling technique was used for the selection of respondents for the study. Data was collected using a self-report questionnaire with both structured and unstructured questions that is hand delivered to randomly selected staff member available on the ground at the time of delivery. Part A asked questions on bio-data. Parts B was on employee empowerment, Part C on time management tendencies, Part D on organizational performance. Cronbach's Alpha was used to measure internal consistency of the questionnaire items. The researcher used both quantitative and qualitative techniques to analyze data collected.

RESULTS AND DISCUSSION

This study investigated the relationship between organizational performance and time management tendencies and also considered the impact of employee empowerment practices on organizational performance for a sample of employees of the University of Nairobi. The study considers how organizational performance is influenced by time management tendencies as defined by the two paradigms of the attention-based theory and reasoned-action theory. The three different but somewhat related proxies were used for organizational performance, namely: service quality, rate of innovation (as measured by introduction of new products or investment in research and development), and employee satisfaction. Organizational performance was held as the dependent variable while the independent or predictor variables were extracted from the various elements that separately make up the attention-based and the reasoned-action time theories.

I: Internal Consistency of Data

The management scales used in this study had a high internal consistency as measured by Cronbach's alpha. The test variables were split and averaged in all possible ways before finally examining their degree of correlation. The study's fifty one (51) cases had a total of seventy four (74) variables. Table 1 shows a summary of the results for the data's internal consistency:

Table 1: Internal consistency statistics for the measurement scales

Statistics for the scale	Value
Mean	188.43
Variance	687.13
Standard deviation	26.21
Cronbach's alpha	0.88

Cronbach (1990) has indicated that the closer to a score of 1 the alpha coefficient is, the higher the internal consistency while a score of 0.60 or less indicates that the items measure different characteristics. The score for this study is 0.88 which confirms that there is a high internal consistency in the data collection instruments. Thus, the findings from this research and conclusions drawn from it can be considered reliable.

Profile of Respondents

This study was conducted from a sample of 51 employees of the University of Nairobi. Male employees were 21 while females were 30. These employees were distributed across various job titles as shown in table 2:

Table 2: Composition of Respondents by job title

Job title	Frequency (n)	Percent
Tutorial fellow	3	5.9
Lecturer	9	17.6
Cleaner	3	5.9
Clerk	7	13.7
Secretary	11	21.6
Administrative Assistant	15	29.4
Senior technologist	3	5.9
Total	51	100.0

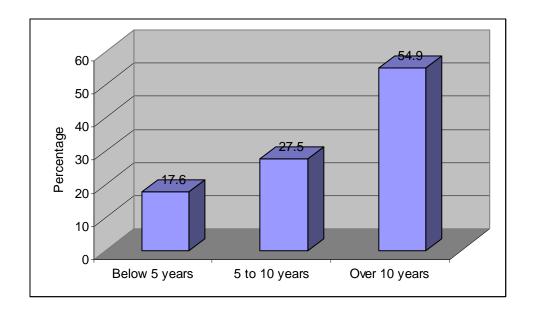

From the table, non-teaching staff (that is, all job categories excluding tutorial fellow and lecturer) comprised the largest percentage of the sample (76.5%). Teaching staff comprised only about one-quarter of the sample size (23.5%). Respondents were drawn from the University's various Colleges as shown in Table 3 next:

Table 3: Composition of respondents by College

College	Frequency (n)	Percent
Health sciences	11	21.6
Agriculture and veterinary Sciences	8	15.7
Architecture and Engineering	4	7.8
Biological and Physical Sciences	7	13.7
Education and External Studies	11	21.6
Humanities and Social Sciences	10	19.6
Total	51	100.0

Respondents had worked in the University for varying periods, ranging from under five (5) years to over ten (10) years. This information is shown in Figure 2:

Figure 2: Composition of respondents by period of service

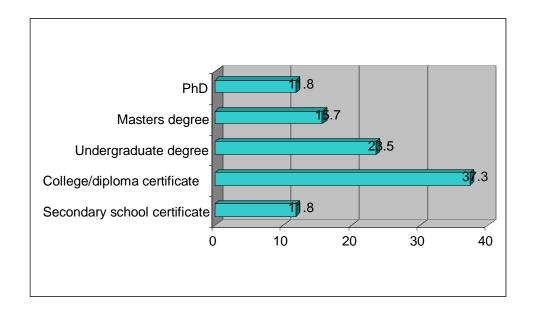

Thus, from Figure 2, more than half of the respondents (54.9%) have worked at the University for a long time (over 10 years). In total, 82.4% of respondents have been at the University for five or more years. From this fact, we expect that these employees constitute a good sample for any study on workplace empowerment and time management practices. Most of the employees were also mature in age as Table 4 shows:

Table 4: Age category of the respondents

Age bracket	Frequency (n)	Percent
20 - 29 years	12	23.5
30 - 39 years	16	31.4
40 - 49 years	18	35.3
Over 50 years	5	9.8
Total	51	100.0

From table 4, more than three-quarters (76.5%) of the employees are aged 30 years and above. Only about one-quarter can be considered youthful, that is, aged 20 to 29 years. Most of the respondents had high educational qualifications with a large percentage possessing a college certificate and above, as Figure 3 shows:

Figure 3: Educational qualifications of respondents

Employees possessing a college certificate were the majority in the sample (37.3%), while those with a PhD degree were the least (11.8%). The percentage of employees possessing a secondary school certificate was also small (11.8%) with most of them mainly distributed in the non-teaching job categories of cleaning and other janitorial work.

Respondents were on a wide range of employment status, namely: permanent (66.7%), contract (27.5%), and casual (5.9%) and were spread across various job categories and grades as shown in the table 5:

Table 5: Distribution of respondents by job grade

Job grade	Frequency (n)	Percent
Academic (teaching)	16	31.4
Academic (non-teaching)	3	5.9
Grade A - F	27	52.9
Grade I - IV	2	3.9
Casual	3	5.9
Total	51	100.0

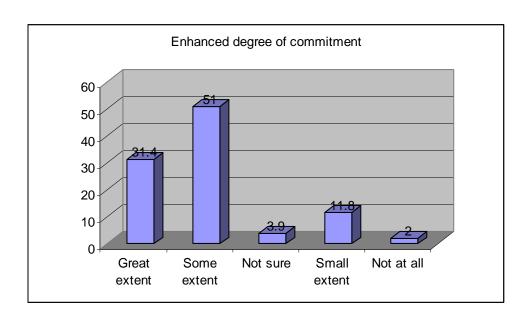

From table 5, slightly more than half of the employees were in Grade A-F and these comprised the largest percentage of the sample size. The composition of academic staff was also sizeable (about one-third).

II: Discussion of Results

Employee empowerment

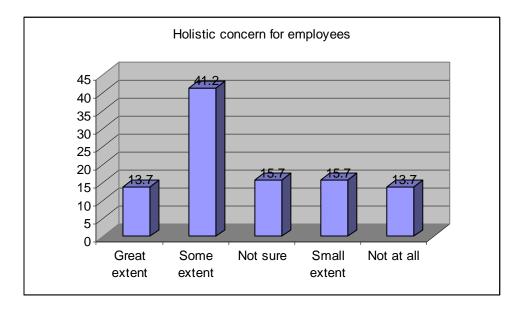

Respondents rated workplace empowerment programmes as successful to "some extent" (mean score is 2.51, where 1 represents "to a great extent" and 5 "no extent at all"). Thus, management efforts in putting in place workplace empowerment initiatives have not been as successful as envisioned. Figure 5 shows scores for selected empowerment variables:

Figure 5: Degree of commitment employees have to put more effort

The figure above shows that 31.4% of employees report that empowerment efforts have enhanced their degree of commitment to "a great extent" while over half (51.0%) report enhanced degree to "some extent". The results for management's efforts for holistic concern to employees are shown in Figure 6:

Figure 6: Management's holistic concern for employees

The figure above shows that only a small percentage of employees (13.7%) report that management's holistic concern for them has motivated them to a "great extent" while 41.2% reported that such efforts have been helpful to "some extent".

The scores (in percentage) for other empowerment variables are shown in the next table:

Table 6: Scores for workplace empowerment variables

	Extent (%)				
Variable	Great	Some	Not sure	Small	Not at all
Congenial friendly atmosphere	9.8	64.7	9.8	15.7	
Organizational feedback	13.7	54.9	3.9	21.6	5.9
Sense of meaning and value	13.7	45.1	13.7	21.6	5.9
Employee job satisfaction	19.6	9.8	45.1	5.9	
Opportunity to choose tasks	9.8	49.0	5.9	33.3	2.0
Independence in decision-making	7.8	45.1	7.8	23.5	15.7
Increased customer satisfaction	39.2	49.0		11.8	

All in all, management has not been successful in putting in place effective workplace empowerment efforts that can motivate employees to put in extra effort to achieve desired goals and objectives.

Relationship between Organizational Performance and Time Management Practices

The study looked at time management practices from the perspective of monochronic and polychronic orientations and considered the impact of these orientations on organizational performance.

A: Models on Attention Based Theory

(i) Selective attention to external events model

The selective attention to external events model statistics is shown in Table 7 and shows that the regression models for organizational performance are significant (as shown from their *p*-values).

Table 7: Summary of attention-based model statistics

Organizational	Statistics

performance proxy	R	R^2	p-value
Service Quality ¹	0.374	0.140	0.007
Rate of Innovation ²	0.488	0.238	0.001
Employee satisfaction ³	0.483	0.233	0.002

Multiple regression models to mathematically demonstrate the relationship between organizational performance and selective attention variables are shown below:

Multiple Regression Models:

Service Quality¹:

 $Y^{l} = 4.457 - 0.401X_{l}$

Where:

 $Y^{l} = Service Quality$

 X_1 = Complete an entire project every day

Rate of Innovation²:

 $Y^2 = 2.505 + 0.488 X_1 - 0.315 X_2$

Where:

 $Y^2 = Rate\ of\ Innovation$

 $X_I = Employee \ prefers \ to \ do \ one \ thing \ at \ a \ time$

 X_2 = Seldom work on more than a single task

Employee satisfaction³

 $Y^3 = 3.515 - 0.330 X_1 + 0.271 X_2$

Where:

 $Y^3 = Employee satisfaction$

 $X_I = Seldom \ work \ on \ more \ than \ a \ single \ task$

 $X_2 = Employee$ would rather complete an entire project

ii. Attention-based Channels of Communication

Table 8: Summary of attention based on channels of communication

Organizational	Statistics		
performance proxy	R	R^2	p-value
Service Quality ¹	0.762	0.580	0.000
Rate of Innovation ²	0.484	0.234	0.000
Employee satisfaction ³	0.437	0.191	0.001

Service Quality¹

 $Y^{I} = 1.535 + 0.765 X_{I} - 0.412 X_{2} - 0.228 X_{3}$

Where:

 $Y^{l} = Service Quality$

 $X_1 = Commitment to organizational feedback$

 X_2 = Emphasis on congenial and friendly atmosphere

 $X_3 = Greater cooperation, teamwork and support$

Rate of Innovation²:

 $Y^2 = 1.010 + 0.524 X_1$

Where:

 Y^2 = Rate of innovation (measured by investment in research and development)

 $X_1 = Free \ and \ open \ communication$

Employee satisfaction³

 $Y^3 = 1.985 + 0.382 X_1$

Where:

 $Y^3 = Employee satisfaction$

 $X_I = Free$ and open communication

B: Models on Reasoned-action Theory

Under this theory, individuals consider the consequences of acting monochronically or polychronically. Thus, as the time for each task is reduced, the employee takes into account the priority to be given to

each task that is waiting to be done. The study found only two significant predictor variables for organizational performance. These are shown next:

 X_{I} = Employee finds it more important to deliver good work even if takes more time than allocated

 X_2 = Employee feels uncomfortable when work is not 100% complete within the time allocated

Using the reasoned-action model, the following multiple regression models were develop for organizational performance (the dependent variable) as represented by service quality, rate of innovation, and employee satisfaction. Stepwise multiple regression has been used in order to include only significant variables, as shown by the *p*-values in the next table:

Table 9: Regression statistics for the reasoned-action model

Organizational	Statistics		
Performance proxy	R	R^2	p-value
Service Quality ¹	0.324	0.105	0.020
Rate of Innovation ²	0.479	0.230	0.002
Employee satisfaction ³	0.404	0.163	0.003

The relevant models are shown next:

Service Quality¹

 $Y^{l} = 1.246 + 0.343 X_{l}$

Rate of Innovation²:

 $Y^2 = 1.254 + 0.383 X_1 - 0.231 X_2$

Employee satisfaction³

 $Y^3 = 1.933 + 0.509 X_1$

Where:

 X_1 = Employee finds it more important to deliver good work even if takes more time than allocated

 X_2 = Employee feels uncomfortable when work is not 100% complete within the time allocated

III: Correlation Analysis for Relationship between Organizational Performance and Time Management Tendencies

A: Monochronic Orientation

Table 10: Correlation Results for monochronic orientation management tendencies and performance

satisfaction $r = -0.374**$ $p = 0.007$	r = 0.306* $p = 0.029$ $r = 0.333*$
	p= 0.029
p = 0.007	•
	r = 0.333*
	1 0.555
	p= 0.017
r = 0.306*	
p = 0.029	

^{**} Correlation significant at the 0.01 level (two-tailed)

Our study found that an employee's tendency to complete an entire project every day rather than parts of it is significantly correlated with employee satisfaction, customer satisfaction, and superior products. The study also found that an employee's tendency to complete one project at a time is significantly correlated with superior products while employee's preference to do one thing at a time is significantly correlated with customer satisfaction. The study also found significant correlation between an employee's seldom working on more than one task at a time and employee satisfaction.

^{*} Correlation significant at the 0.05 level (two-tailed)

B: Polychromic Orientation

Table 11: Correlation Results for customer satisfaction and service quality

Polychromic variable	Customer satisfaction	Service quality
Employee juggles several activities	r = - 0.465**	
	p = 0.001	
Employee believes people should be given several		r = 0.431**
tasks to perform at the same time		p = 0.002
Employee manages to do many things in a short	r = - 0.456**	
time	p = 0.001	

^{**} Correlation significant at the 0.01 level (two-tailed)

This study found that the following dimensions of empowerment: "employee juggles several activities", and "employee manages to do many things in a short time" are significantly correlated with customer satisfaction, while "employee believes that people should be given several tasks to perform at the same time" is significantly correlated with service quality.

III: Conclusions

The study found that efforts that University management has made to empower employees have not been as successful as was expected. Majority of employees rated empowerment efforts as successful only to "some extent". Efforts to enhance employees' degree of commitment, holistic concern for employees, opportunity to choose tasks and independence in decision-making were all rated as mildly successful.

The study also found that the significant empowerment attributes for the selective attention model are: employees' ability to complete an entire project everyday, employees' preference to do one thing at a time, and their opportunity not to work on more than a single task at any one time.

Organizational empowerment practices that have a significant impact on time management tendencies were found to be the following: management's commitment to organizational feedback, management's

emphasis on a congenial and friendly atmosphere, its emphasis on greater cooperation, teamwork, and support, and a free and open communication environment.

The significant time management tendencies that define the reasoned-action theory were those that made it possible for employees to do good work even if took more time than allocated and those that allowed employees to complete their work up to 100% even if the time allocated expired, that is, situations that allowed for time extension to enable employees complete the work to full satisfaction.

The study found a negative relationship between the rate of innovation, which is a measure of organizational performance, and employees being forced to complete their work within time allocated. This indicates that employees working on research and development do not prefer to be hurried on their work and would prefer, rather, to have all the time they need to complete their innovations.

Monochronic tendencies were found to be positively and significantly correlated with organizational performance. Thus, when employees are allowed to complete an entire project every day rather than parts of it, and when employees' preference to do one thing at a time is supported, there is a positive correlation with customer satisfaction, rate of innovation, and employee satisfaction.

The study found that, under the polychronic orientation, employees' juggling of several activities and their ability to do many things in a short time has positive and significant correlation with customer satisfaction. We also found that employees who believed that people should be given several tasks to perform at the same time were more likely to show a positive correlation with the organization's ability to produce superior products.
