SEED QUALITY ASSURANCE, MANAGEMENTAND CONTROL PROCESSES

24th April- 6th May, 2017

Identification and management of seed borne insect

Seed Enterprises Management Institute

Prof. Florence Olubayo. MBS

Introduction

- Factors such as storage duration, prevailing environmental conditions and crop varieties influence insect populations development and losses incurred.
- Inadequate storage methods lead to losses in stored grain sometimes of unacceptable magnitude in SSA.
- These pests inflict both direct and direct damage to the grain, and the most important ones start in the field.

Damage caused

Direct damage

- Kernel damage,
- Contamination,
- Grain dust,
- Damage to wooden structures and other containers **Indirect damage**
- Dry grain heating and moisture migration in storage
- Lowered germination of seed grainsment Institute
- Distribution of molds and other organisms through the grain mass
- Insect fragments in cereal products

PEST IDENTIFICATION CEREAL PESTS

THE GRAIN MOTH(*Sitotroga cereallella* (ol.)

- Small straw coloured moth (wing span 10-18mm)
- Able to fly from infested grain in store to the field
- Infests maturing cereals in the field
- Infestation can also occur at store levels.
- Damage:- small circular 'windows' and holes on the grain
- Causes severe damage to cereals stored mainly in unthreshed form
- Grain attacked: maize, sorghum, wheat, paddy

SITOTROGA CEREALELLA

(Angoumois Grain Moth)

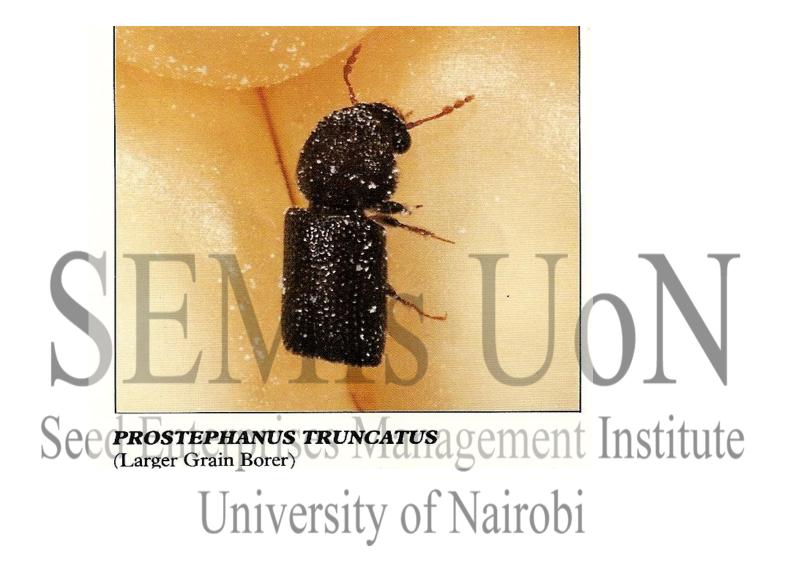

MAIZE AND RICE WEEVILS (*Sitophilus* spp.)

- Dark brown weevils (2.5-4.5mm long)
- Able to fly from infested grain in store to the field.
- Infests maturing cereals in the field
- Infestation can also occur at store level
- Damage: Small circular holes on the surface of the grain
- Causes severe damage to grain stored in both the threshed and unthreshed form
- Grain attacked:- maize, millet, sorghum, wheat, barley and rice

LARGER GRAIN BORER (Prostephanus truncantus(H.)

- A dark brown cylindrical beetle (3-4.5mm long)
- Able to fly from infested grain in store to the field
- Infests maize in the field before harvest
- Infestation can also occur at store level
- The beetle eats tunnels and holes in the husks, grain and cob.
- Very serious pest that also eats into the wooden te store structures
- Also feeds on dried cassava in addition to cereals

PEST IDENTIFICATION LEGUME PESTS

PULSE BRUCHIDS (BEETLES)

- THE BEAN BRUCHID (*Acanthoscelides obtectus* (say)).
- Grey to brown oval beetles (3 4.5mm long)
- Able to fly from infested grain in the store to the field
- Infestation can also occur at store level
- Damage:- small dark 'windows' and holes on the grain
- Causes serious damage to stored beans

ACANTHOSCELIDES OBTECTUS (Bean Beetle)

THE COWPEA BRUCHIDS (*Callosobruchus* spp)

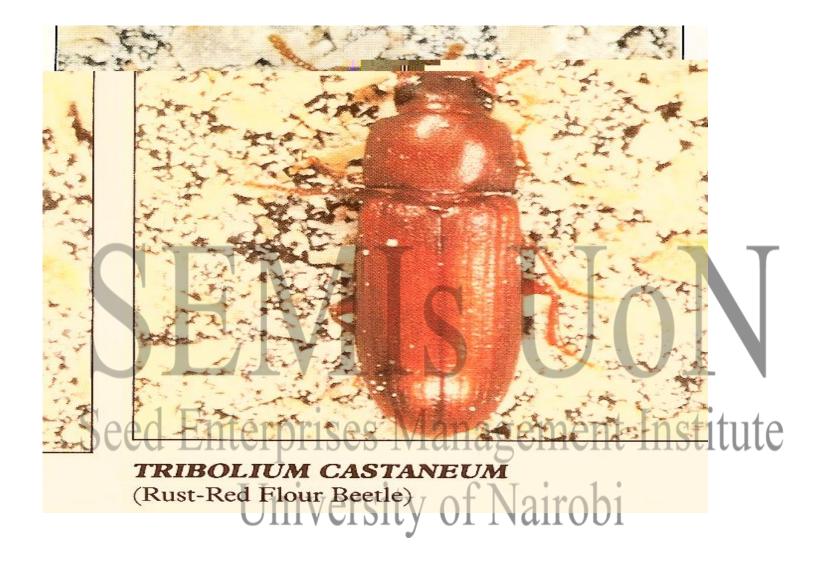

- Light to dark brown beetles (2.0-3.5mm long)
- Able to fly from infested grain in stores to the field
- Infests maturing legumes (cowpea, pigeon peas, chick peas and grains) in the field
- Infestation can also occur at store level
- Small dark 'windows' and holes on the grain indicate infestation by the bruchids
- Causes serious damage to stored pulses.

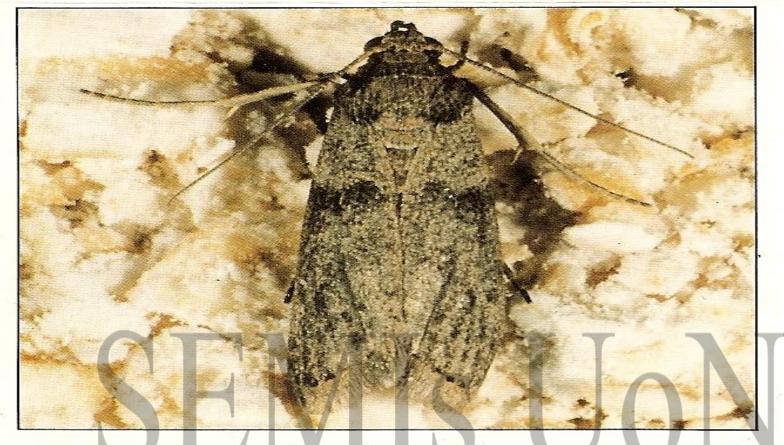

Callosobruchus spp.

GENERAL FEEDERS – SECONDARY PESTS

- THE FLOUR BEETLE (*Tribolium* spp)
- Reddish brown flat beetles (2.5 4.5 mm long)
- Infests stored (broken) grain and milled products
- Causes high level of grain contamination
- Presence of reddish brown beetles, cast skins and faecal pellets on damaged grain and milled products indicates infestation by these beetles.
- Serious secondary pests of all stored grain and milled grain products

EPHESTIA spp.

(Tropical Warehouse Moths)

Several species of *Ephestia* may be encountered in tropical stores. They attack a wide range of products particularly damaged or processed cereals, dried fruit, nuts, cocoa and even tobacco. Only the larvae feed. They also leave trails of silk which can form a thick webbing over and in the stored food. Reconditioning food to remove webbing can be very costly. (Wing span 11-28 mm)

Some Management Practices

Post- havest Insect pest control should begin before the crop is mature and must definitely begin before it is harvested and put in drying structures.

Proper program for insect control include:

 Select plant varieties with good husk cover and inherent resistance to field and storage pests
University of Nairobi

- Repair the store and thoroughly clean before the new crop is mature.
- Clear the surroundings of the store of any waste that can harbor insect pests
- Harvest early to avoid field infestation
- Dry the grain as fast as possible and shell it when dry
- Shell carefully to avoid damage to the kernels
- Treat the dry grain with an appropriate stitute insecticide University of Nairobi

- Carry out regular inspections of the stored grain to detect any infestation and take control measures as necessary
- Carry out principles of good store management, including maintenance, stock rotation and hygiene. Seed Enterprises Management Institute University of Nairobi
