SEED Processing involved three steps

Step 1
Pre- conditioning and pre cleaning
Pre conditioning: Isolation of seed from plant parts with which it was harvested e.g. Shelling
Pre cleaning: Removal of external materials like trash, stones, clods which are either in larger size or lighter in weight. No pre cleaning is required for hand harvested and winnowed seeds.
Step 2

Cleaning
The second stage of cleaning is carried out with air blasts and vibrating screens and is applicable to all kinds of seeds. It is essentially the same as scalping but more refined. It is performed mostly by one machine known as air-screen cleaner.

Air-Screen cleaner cum grader

The air-screen machine is the basic cleaner in most seed processing plants.

Step 3

Cleaning and Grading
