Master Thesis
Submitted to the School of Mathematics in partial fulfilment for a degree in Master of Science in Applied Mathematics

Submitted to: The Graduate School, University of Nairobi, Kenya
Abstract

The properties of $W_6$-curvature tensor are studied in lp-sasakian manifold and following theorem proved:
- A $W_6$ skew symmetric lp-sasakian manifold
- A $W_6$ symmetric lp-sasakian manifold
- A study of properties of $w_6, P$ and $Q$ curvature tensors in lp-sasakian manifold.
Declaration and Approval

I the undersigned declare that this dissertation is my original work and to the best of my knowledge, it has not been submitted in support of an award of a degree in any other university or institution of learning.

Acknowledgments

First, I thank my supervisors Prof G.P Pokhariyal and Prof Moindi Stephen. It has been my pleasure to interact with them both in and outside the classroom. I must acknowledge school of mathematics, my classmates and family members not forgetting my friends who helped me both emotionally and financially. ....

Wilson Kamami Wanjiru

Nairobi, 2018.
1 Introduction

Riemannian geometry was first put forward in generality by Bernhard Riemann in the nineteenth century. It deals with a broad range of geometries whose metric properties vary from point to point, including the standard types of Non-Euclidean geometry.

Any smooth manifold admits a Riemannian metric, which often helps to solve problems of differential topology. It also serves as an entry level for the more complicated structure of pseudo-Riemannian manifolds, which (in four dimensions) are the main objects of the theory of general relativity. Other generalizations of Riemannian geometry include Finsler geometry. There exists a close analogy of differential geometry with the mathematical structure of defects in regular crystals. Dislocations and Discrimination produce torsion’s and curvature.

1.1 Definition

1.1.1 Differentiable manifold

The basic idea that leads to differentiable manifold is to try to select a family or sub collection of neighbourhood so that the change of cordinates is always given by differentiable functions. As to definitions of differentiable manifold we first look at n-dimensional serial space $R^n$ as product space of R. where R is set of real numbers. $R^n$ is obtained taking n-copies of R

Example

$R^n = R \times R \times R \times \ldots \times R$;

$R$ n-times where $n$ is any integer greater than zero in $R^n$ each element can be represented by $n$ - tuples so that for every $x \epsilon R^n$

$x = (x_1, x_2, \ldots, x_n)$, where $x_i \epsilon R$

and $i = 1, 2, 3, \ldots, n$

let us take two arbitrary points in $R^n$ then for every such pair we can define metric on $R^n$ by $d(x,y)=\left( \sum_{i=1}^{n} (x_i - y_i)^2 \right)^{\frac{1}{2}}$
then $\mathbb{R}^n$ becomes metric space with metric topology as defined above for future discussion $\mathbb{R}^n$ is been considered as topological space with $M$ being open subset. The definition of topological manifold $M$ of dimensional $n$ is a Hausdorff space with countable basis of open sets and with further property that each point has a neighborhood homomorphic to open subset of $\mathbb{R}^n$.

Differentiable manifold

Let $v_n$ be non empty para compact Hausdorff space. Then $v_n$ is said to be $n$-dimensional topological manifold if every point $x \in v_n$ has open neighborhood $U$ in $v_n$ which is homomorphic to an open subspace of the $n$-dimensional euclidean space $\mathbb{R}^n$.

1.1.2 Differentiable structure

Concept of differentiable structure is studied in this section which form basis of differentiable manifold. First we look at element of differentiable structure namely chart and atlases.

charts

For chart $X$ we mean imbedding $\Phi: U \rightarrow \mathbb{R}^n$ of open subspace $U$ of $X$ into $\mathbb{R}^n$ such that $\Phi(U)$ in open subspace of $\mathbb{R}^n$. where $U$ domain of chart

let $\Phi: U \rightarrow \mathbb{R}^n$ is called local coordinate system for every $x \in U$ then real numbers $(t_1, t_2, ..., t_n) = (\Phi_1(x), ..., \Phi_n(x)) \in \mathbb{R}^n$ are said to be coordinates of point $x$ with respect to chart $\Phi$.

Let $f: W \rightarrow \mathbb{R}$ denotes function of non-empty space $W$ of $\mathbb{R}^n$. Then $f$ is said to be

1. (a) of class $C^k$, $k=1,2,3,..........$ if and only if $f$ has partial continuous derivative of all order $r \leq k$
ii. of all class \( c^0 \) if and only if its continuous

iii. of class \( c^\infty \) or smooth if its of class \( c^k \) for every positive integer.

iv. of class \( c^w \) if it is analytic function.

A function \( f : w \rightarrow R^n \) for an open subspace \( w \) of \( R^n \) into \( R^n \) is said to be of class \( c^k \) if and only if for every \( i = 1, 2, 3, \ldots, n \), the composed function \( f_i = p_i : w \rightarrow R^n \) of class \( C^k \)

**Atlas**

It is a collection \( \alpha \) of charts of \( X \) satisfying following condition

i. The domain of the chart in \( \alpha \) cover the \( n \)-manifold

ii. For any two chart \( \Phi : U \rightarrow R^n \) and \( \varphi : V \rightarrow R^n \) in \( \alpha \) with \( U \cap V \neq \emptyset \) the function

\[
f(\Phi, \varphi) : U \cap V \rightarrow R^n
\]

defined by \( f(\Phi, \varphi)(t) = \varphi[\Phi^{-1}(t)] \) for every point \( t \in \Phi(U \cap V) \) is of class \( c^k \).

Function \( f(\Phi, \varphi) \) is known as connecting function of 2 charts \( \Phi \) and \( \varphi \) for every \( x \in U \cap V \) we have

\[
f(\Phi, \varphi)[\Phi(x)] = \varphi(x), \text{ hence } f(\Phi, \varphi) \text{ is usually called the transformation for change of local coordinate system from } \Phi
to \varphi. \text{ Thus, we have enough concept to define differentiable structure.}

**Definition 1**

Let \( c^k \) be set of all atlases on \( X \) of class \( c^k \). If \( K \neq 0 \), this set may be empty. The relation of \( X \) defined by \( \alpha \sim \beta \) if and only if \( \alpha \cup \beta \) is an atlas in \( c^k(x) \) for any two atlases \( \alpha, \beta \in c^k(x) \). This is an equivalence relation in \( c^k(x) \) into disjoint equivalence classes. Each of equivalence classes is called called differentiable structure of class \( c^k \) in the given \( n \)-manifold \( X \). Two atlases \( \alpha \) and \( \beta \) are known to be compatible if their union is an atlas.

**Definition 2**
A differentiable or $c^\infty$ (or smooth) structure on topological manifold $M$ is a family $U = (U_\alpha, \varphi_\alpha)$ of coordinates neighborhood such that the following are satisfied

i. The $u_\alpha$ cover $U$

ii. for any $\alpha, \beta$ the neighborhood $((U_\alpha, \varphi_\alpha)$ and $(U_\beta, \varphi_\beta)$ are $c^\infty$ compatible

iii. Any coordinate neighborhood $(U_\alpha, \varphi_\alpha)$ compatible with every conditions $(U_\beta, \varphi_\beta) \epsilon U$ is itself $U$.

**Differentiable n-manifold**

An $n$-manifold $X$ together with given differentiable structure $A$ of class $c^k$ on $X$ is called differentiable $n$ manifold .

**Diffeomorphism**

Let $X$ and $Y$ be differentiable $n$-manifold of class $c^k$. Let also $h \leq k$. If the function $f: X \to Y$ is homeomorphism and both $f$ and $f^{-1}$ (its inverse) are function of class $c^h$ then $f$ is called diffeomorphism

**1.1.3 Tangent vector and tangent spaces**

**Definition 1**

Let $p$ be an element of $v - n$ and let $c^\infty(p)$ be set of real valued function that are $c^\infty$ on some neighborhood $U$ of $p$. A vector $X$ at $p$ is said to be a tangent vector at $p$ if it satisfy the following properties

i. $x \epsilon v_n$, $f \epsilon C(p)$ then $Xf \epsilon C(p)$

ii. $x(f+g)= xf + Xg : f,g \epsilon C(p)$

iii. $X(fg)=fXg + gXf$
iv. $X(af) = axf \in \mathbb{R}$

The system consist of

i. The set $T_p$ containing all tangent vectors at $P$

ii. The binary operation $+$ satisfying $(X+Y)f = Xf + Yf$

iii. An operation scalar multiplication $fX \in T_p$ and $(aX)f = aXf$ where $a \in \mathbb{R}$ is a vector space called **Tangent space** to $v_n$ at $P$. $t_p$ approximates to $V_n$ at $P$ and is $n$ dimensional.

**Definition 2**

let $m_n$ be $n$-dimensional $c^\infty$ manifold. if $p \in M_n$ and $X$ be $c^\infty$ real valued function of some neighborhood of $P$ and satisfies

$$X(a_1 f_1 + a_2 f_2) = a_1 (X f_1) + a_2 (X f_2)$$

and

$$X(f_1 f_2) = (X f_1) + f_1 (X f_2)$$

where $a_1 a_2 \in \mathbb{R}$ and $f_1 f_2 \in c^\infty$ are real valued function at $P$. Then $x$ is called **tangent vector at point** $P$.

The set of all tangent vector at point $P$ with operation of addition ($+$) and multiplication ($.$) given

$$(X+Y)f_1 = X f_1 + Y f_1$$

and

$$(f_1 X)f_2 = f_1 (X f_2)$$

is a vector space and is called tangent space to $M_n$ at $P$ and is denoted by $T(p)M$ or $t_p$.

1.1.4 Vector field
A vector field \( X \) on set \( B \) is a mapping that assign a to each \( p \) in \( B \) a vector \( x_p \) in the tangent space \( T_p\). A vector field \( x \) on \( B \) is \( c^\infty \) if

i. \( B \) is open

ii. function \( xf \) at \( P \) is \( c^\infty \) on \( AnB \), \( f \) is being a \( c^\infty \) real valued function on \( A \) in \( v_n \)

### 1.2 Tensor Analysis

#### 1.2.1 Tensor Algebra

In this section tensors are defined as element of a vector space. The classical notation in definition is used but on most of the work index free notation is used. Let \( v' \) be an \( n \)-dimensional space and let \( e_i \) and \( \bar{e}_i \) be two basis of \( v' \) then each vector of set \( [\bar{e}_1] \) is linear combination of elements of the set \( [e_i] \) \( i=1,2,3,4........,n \) and vice versa.

let us take

i. \( \bar{e}^i = P_i^j e_j \); where \( p_i^j, q_i^j \in F \)

ii. \( e_i = q_i^j \bar{e}_j \); where \( f \) is scalar field

Putting 2 in 1 above we shall get the following equation

\[
e_i = p_i^k q_k^j \bar{e}_j, \text{ since} [\bar{e}_j] \text{ is linear independent we have},
\]

\[
p_i^k q_k^j \bar{e}_j = \delta^i_j, \text{ consequently}
\]

\[
((p))((q)) = I_n
\]

i.e \( ((p)) \) and \( ((q)) \) are inverse to each other for any vector \( X \in V_n \), we have

\[
X = X^k \bar{e}_k = X^i e_i, \text{ where} \ X^k \text{ and} \ X^i \text{ are component of} \ X \text{ respect to} \ e_1 \text{ and} \ e_i
\]

From i and ii we have

i. \( \bar{X}^k = q_i^k X^i \)
ii. $X^k = p_i^k X^i$

which are equations of laws of transformations of vector $X$. The vector $x$ or any vector in $v_n$ is called contravariant vector of order 1 or tensor type (1,0)

**Tensors**

A linear scalar function or form of $V'$ is linear mapping such that $A(X) \in V'$ is a scalar and $A(fX+gY)=fA(X)+gA(Y); f,g \in F$ and $X,Y \in V'$

**Dual spaces**

Consider $V'$ consisting of

i. a set $V$ of all linear scalar function on $V'$

ii. a binary operation "$+"$ satisfying

$$(A+B)(x)=A(x)+B(x)$$

$A,B \in V^* ; X \in V'$ then $V'$ is vector space called dual of $V'$.

A bi-linear scalar function $T$ over $V \times W$ is a mapping $T: V \times W \rightarrow F$. i.e $T(X,A)$ are $X \in V$ and $A \in W$ is scalar such that

$$T(fX+gY,hA+kB)=fhT(X,A)+fkT(X,B)+ghT(X,A)+gkT(Y,B)$$

where $A,B \in W; X,Y \in V$ and $f,g,h,k \in F$. Consider a system denoted by $V' \times V'$ or $v^2$ consisting of

i. a set $v^{*2}$ of all bilinear scalar function of $V_1 \times V_1$.

ii. A binary operation say "$+"$ satisfying

$$(T+S)(A,B)=T(A,B)+S(A,B) ; T,S \in V^{*2} ; A,B \in v_1$$

iii. an operation of scalar multiplication satisfying

$$(fT)(A,B)=fT(A,B) ; f \in F ; A,B \in v_1$$ then $v^2$ is vector space called the tensor product of $V'$ with itself.
Higher order tensors

We can define mixed tensor as \( A^{t_1t_2\ldots t_s}_{q_1q_2\ldots q_p} \)

This tensor is then called mixed tensor of contravariant order \( s \) and covariant order \( p \). If by interchanging two indices the sign of tensors remain same then we say tensor is symmetric in those indices. If sign changes then is skew-symmetric with respect to two indices. The properties on symmetry and skew-symmetric are independent of the coordinate system. A significant result from transformation laws of tensors is that "if component of a tensor are zero in one coordinate system, then they are zero in any coordinate system". It is this property of tensor that is useful in physical application and when tensor is defined at all points of a curve in space \( v_n \) then we say consist of a tensor field.

**Properties of tensors**

1. **Outer product**
   The outer product of two tensors is equal to tensor whose rank is sum of rank of given tensor and it also involves multiplication of components of the tensor.

2. **Contraction**
   If we set one covariant index of tensor equal to one contravariant index then the resulting tensor will be of rank two less than original tensor. This process is contraction.

3. **Inner multiplication**
   The outer multiplication of two tensors followed by contraction will result to a tensor known as inner product of given tensor

4. Addition and subtraction of tensors of same rank and type result in tensor of same rank and type.

   NB: Two operation are defined only for tensor of same rank and type.

For us to verify whether functions would form components of tensor, we can use transformation laws of which they can be cumbersome so instead we can use the quotient law which is more convenient.
Quotient law

If an inner product of any quantity $X$ with an arbitrary tensor is also a tensor then $X$ is also a tensor.

A tensor $Q$ of type $(r,0)$ is said to be symmetric in $h^{th}$ and $k^{th}$ places if

$$S_{h,k}(Q) = Q$$

and skew symmetric if

$$S_{h,k}(Q) = -Q$$

where $1 \leq h < k \leq r$ and $S_{h,k}$ is a linear mapping which interchanges vector at $h^{th}$ and $k^{th}$ places.

Note it is also applies to a tensor of type $(0,1)$.

1.2.2 Connexion

A connexion $\Delta$ is type preserving mapping assign to each pair of $C^\infty$ field $(X,P)$, a $C^\infty$ vector field $\Delta_xP$ such that if $X,Y,Z$ are $C^\infty$ vector field and $f$ is a $C^\infty$ function then

i. $\Delta_xf = xf$

ii. $\Delta_x(fY) = xfY + f\Delta_xY$

iii. $\Delta_{x+y}Z = \Delta_xZ + \Delta_yZ$

iv. $\Delta_{x+y}f Z = f \Delta_xZ$

and also

$$\Delta_x(Y + Z) = \Delta_xY + \Delta_xZ.$$  

1.2.3 Affine connexion

An affine connexion $\Delta$ on manifold $m$ is map $T(M) \times T(M)$ such that for all $x_i, y_i \in T(M), i=1,2$ we have

i. $\Delta_{x_1+y_2}(Y) = \Delta_{x_1}Y + \Delta_{x_2}Y$

ii. $\Delta_x(Y_1 + Y_2) = \Delta_xY_1 + \Delta_xY_2$

iii. $\Delta_x(fY) = (xf)y + f\Delta_xY$
iv. \( \Delta f_x(Y) = f \Delta_x Y \)

where \( f \) is a \( c^\infty \) real valued function on \( M \).

**Definition 1**

A \( c^\infty \) vector field \( X \) is said to be parallel along smooth curve \( \gamma : t \ldots \gamma(t) \) on \( M \) (with respect to \( \Delta \)) if

\[ \Delta T X = 0 \]

along \( \gamma \) where \( T = d(\gamma(t))/dt \) so if

\[ \Delta T Y = 0 \]

everywhere along \( \gamma \) then \( X \) is parallel along \( \gamma \)

**Definition 2**

A Riemannian structure on \( M \) is covariant tensor field of order 2 (degree) called Riemannian metric with the following properties

i. \( g(x,y) = g(y,x) \) for \( x,y \in T(m) \)

ii. \( g_x : T_x(m) \times T_x(m) \longrightarrow \mathbb{R} \) for \( x \in M \)

where \( g_x \) is a non-degenerate bilinear form on \( T_x(m) \times T_x(m) \) i.e an inner product on \( T_x(m), g_x(y) \)

iii. \( g_x(y,x) = 0 \); for all \( x \in T_x(m) \) if and only if \( y = 0 \)

iv. \( g(x,y) \geq 0 \) for all \( T(m) : g(x,x) = 0 \) which implies \( y = 0 \)

**Definition 3**

A connection \( \Delta \) is compatible with Riemannian metric \( g \) if a parallel transformation along any smooth curve \( \gamma \) on \( M \) preserves the inner product. i.e whenever \( x(t) \) and \( y(t) \) are parallel along \( \gamma \) then \( \langle x(t), y(t) \rangle \) is independent to \( t \).

1.2.4 Lie algebra
Let $M$ be the set of all $e\infty$ vector field on $A$ the brackets $[]$ is defined by mapping

$[]:M \times M \rightarrow M$ such that for $x,y$ in $M$
and
$[x,y]f = xyf - yxf$

where $f$ is smooth function for $x,y,z$ in $M$ we have

i. $[X,Y] = -[Y,X]$
   skew commutative(symmetric)

ii. $[X + Y,Z] = [X,Z] + [Y,Z]$

iii. $[fX,gY] = fg[X,Y] + f(XgY) - g(Yf)X$

iv. $[[X,Y],Z] + [[Y,Z],X] + [[Z,X],Y] = 0$

The last equation is known as Jacobs identity

Example

Let $M_n(R)$ denote the algebra of $n \times n$ matrices over $R$ with $X,Y$ denoting the usual matrix product of $X$ and $Y$. Then
$[X,Y] = XY - YX$

the "commuter" of $X$ and $Y$ defines a lie algebra structure on $M_n(R)$ as easily verified. If $f$ is $c^\infty$ on any open set $U \subset M$ then so is $(XY-YZ)f$ and therefore $Z$ is a $c^\infty$ vector field on $M$ as said.

We may define a product on $T(m)$ using the fact; namely, define the product of $X$ and $Y$ by $[X,Y] = XY - YX$

Let us consider the following theorem;

**Theorem 1.2.4.1**

$T(M)$ with the product $[X,Y]$ is a lie algebra.

**Proof**
If \( \alpha, \beta \in \mathbb{R} \) and \( X_1, X_2, Y \) are \( c^\infty \) vector field then it is straightforward to verify that
\[
[\alpha X_1 + \beta X_2, Y]f = \alpha [X_1, Y]f + \beta [X_2, Y]f
\]

Thus \([X, Y] \) is linear in the first variable. Since the skew commutative \([X, Y] = -[Y, X] \) is clear from definition. We see linearity in the first variable implies linearity in the second variable. Therefore \([X, Y] \) is bilinear and skew commutative. There remain Jacobi identity which follows if we evaluate
\[
[X, [Y, Z]] + [Y, [Z, X]] + [Z, [X, Y]]
\]
apply to \( c^\infty \) function \( f \). We obtain
\[
[X, [Y, Z]]f = X([Y, Z]f) - [Y, Z](Xf)
\]
\[
= X(Y(Zf)) - X(Z(Yf)) - Y(Z(Xf)) + Z(Y(Xf))
\]
permuting cyclically and adding establishes the identity.

### 1.2.5 Lie bracket and covariant Derivatives

Let \( X, Y, Z \) be \( c^\infty \) vector field on \( m_n \). Then lie brackets is mapping
\[
[] : M_n \times M_n \ldots > M_n
\]
such that
\[
[XY]f = X( Yf ) - Y( Xf ) \text{ f being } c^\infty \text{ function.}
\]

This satisfies the following properties

i. \([X, Y](f_1 + f_2) = [X, Y]f_1 + [X, Y]f_2\)

ii. \([X, Y](f_1 f_2) = f_1 [X, Y]f_2 + f_2 [X, Y]f_1\)

iii. \([X, Y] + [Y, X] = 0\)

iv. \([X + Y, Z] = [X, Z] + [Y, Z]\)
v. \([f_1X, f_2Y] = f_1f_2[X,Y] + f_1(Xf_2)Y - f_2(Yf_1)X\)

and further it satisfies Jacobi identity

i.e.

\([X, [Y, Z]] + [Y, [Z, X]] + [Z, [X, Y]] = 0\)

The covariant derivative \(\Delta\) is a mapping \(\Delta : T^r_s \rightarrow T^r_{s+1}\) such that

\(\Delta_p(a_1, \ldots, a_r, X_1, \ldots, X_{s+1}) = (\Delta_{s+1}p)(a_1, \ldots, a_r, X_1, \ldots, X_s)\)

where \(p \in T^r_s\), \(a_2, \ldots, a_r \in T^s(p)\) and \(X_1, X_2, \ldots, X_s \in T^*_p\)

### 1.2.6 Lie bracket and Exterior Derivatives

Let \(X\) be \(c^\infty\) vector field on an open set \(A\). Lie derivative via \(X\) is a type preserving mapping

\(L_x : T^r_s \rightarrow T^r_s\) such that

i. \(L_x f = xf\), where \(f\) is \(c^\infty\)

ii. \(L_x a = 0\), \(a \in \mathbb{R}\)

\(L_x Y = [X, Y], Y \in T^*_p\)

\((L_x A)(Y) = X(A(Y)) - A([X, Y])\)

where \(A \in T^*_p\) and \((L_x p)(a_1, \ldots, a_r, X_1, \ldots, X_s) = X(p(a_1, a_2, \ldots, X_s), \ldots, p(a_1, \ldots, [X, X_s]))\)

where \(p \in T^r_s\). Let \(v_p\) be \(c^\infty\). \(p\) forms an open set \(A\). Then the mapping

\(d : V_p \rightarrow V_{p+1}\) given by

\((df)(x) = xf\), where \(x \in T^*_p\) and \(f\) is \(c^\infty\) function on \(A\) thus from above it is clear now we can define the following as

\((dA)(X_1, \ldots, X_{p+1}) = X_1(A(X_2, \ldots, X_{p+1})) + X_2(A(X_1, X_3, \ldots, X_{p+1})) + \ldots + \ldots\)
\[ +X_{p+1}(A(X_1,X_2,\ldots,X_p))-A([X_1,X_2]X_3,\ldots,X_{p+1})-A([X_1,X_3],X_2,X_4,\ldots,X_{p+1}) \]
\[-A([X_2,X_3],X_1,X_4,\ldots,X_{p+1})] \]

for all arbitrary \( c^\infty \) fields \( X \in V \) and \( A \in V_p \) is called **exterior derivative**

**1.2.7 Torsion tensor of a connexion**

The torsion tensor of a connexion \( D \) is defined as a vector valued bilinear function \( T \) which assigns to each pair of \( c^\infty \) vector \( X \) and \( Y \) with domain \( A \), a \( c^\infty \) vector field \( T(X,Y) \) with domain \( A \) and is given by

\[ T(X,Y)=D_XY-D_YX-[X,Y]. \]

A connexion is said to be symmetric if torsion tensor vanishes and a connexion \( D \) is said to be Riemannian if

i. \( T(X,Y)=0 \)

and

ii. \( D_xg=0 \)

**1.2.8 Curvature Tensor**

Consider a connexion \( D \) then the operator \( K_{XY} \) defined by

\[ K_{XY} = [D_X,D_Y] - D_{[X,Y]} \]

is called the curvature operator.

Then curvature \( K \) of the connexion \( D \) is defined as

\[ K(X,Y,Z)=K_{XY}Z \]

which can be written as

\[ K(X,Y,Z)=[D_X,D_Y]Z-D_{X,Y}Z \]

\[ =D_XD_YZ-D_YD_XZ-D_{X,Y}Z \]

where \( k \) is vector valued function. The curvature tensor \( K \) satisfies two identities

i. \( K(X,Y,Z)+K(Y,Z,X)+K(Z,X,Y)=0 \)

and

which are called Bianchi first and second identities respectively.

**Proof**

Let \(D\) be a symmetric connexion then

\[K(X,Y,Z)+K(Y,Z,X)+K(Z,X,Y)\]

\[=[[X,Y],Z] + [[Y,X],Z] + [-[Z,X],Y]=0\] by Jacobi identities. Thus we have

\[K(X,Y,Z)+K(Y,Z,X)+K(Z,X,Y)=0\]

Similarly we also get

\((D_X K')(Y,Z,W) + (D_Y K')(Z,X,W) + (D_Z K')(X,Y,W) = 0\)

Let us put \(K'(X,Y,Z,W) = g(K(X,Y,Z),W)\).

It can be noted that \(K'\) satisfy the following conditions

A. is skew symmetric in the first two slot as well as in the last two slot

B. satisfy first and the second banachi identity

C. symmetric in two pair of slot

i.e \((XY)\) and \((Z,W)\)

**Difference tensor of two connexion**

Consider a smooth manifold \(M\) and let \(D\) and \(\tilde{D}\) be two connexion on \(M\) for two field \(X\) and \(Y\) on \(M\). We define difference tensor by

\[B(X,Y) = \tilde{D}_X Y - D_X Y\]
Linearlity of B slot is trivial result from properties of connexion. Let us consider slot 2 and let f be \( c^\infty \) on domain X and Y then

\[
B(X,fY) = (Xf)Y + fD_XY - (Xf)Y - fD_XY = fB(X,Y)
\]

If we decomposed B(X,Y) into symmetric and skew symmetric pieces we have

\[
B(X,Y) = S(X,Y) + Z(X,Y)
\]

where

\[
S(X,Y) = \frac{1}{2}[B(X,Y) - B(Y,X)]
\]

symmetric part

and

\[
A(X,Y) = \frac{1}{2}[B(X,Y) - B(Y,X)]
\]

skew symmetric part

Then we can express A in terms of torsion tensors \( T \) and \( \bar{T} \) of connexion \( D \) and \( \bar{D} \) respectively as for

\[
2A(X,Y) = B(X,Y) - B(Y,X)
\]

\[
= D_XY - D_XY - \bar{D}_YX - \bar{D}_YX
\]

\[
= T(X,Y) - T(X,Y) + [X,Y] - [X,Y]
\]

\[
= T(X,Y) - T(X,Y)
\]

Let the two connexion \( D \) and \( \bar{D} \) be related in \( V_n \) by

\[
\bar{D}_X Y = D_X Y + A(X)Y + A(Y)X
\]

where A is a 1-form and X and Y are vector field in \( V_n \) then D and \( \bar{D} \) are said to be projectively related.

1.2.9 Ricci Tensor

The tensor defined by \( Ric(Y,Z) = (C',K)(Y,Z) \) is called tensor of type(0,2), where \( C' \) denote contraction. Its symmetric tensor
Ric(X,Y)=Ric(Y,X), the ricci tensor of type (1,1) is defined by

g(R(X),Y)=Ric(X,Y), the scalar curvature r is defined by

\[ C_1' R = \text{def } r \]

1.2.10 The weyl projective curvature tensor

This is defined by

\[ W(X, Y, Z) = \]

\[ K(X, Y, Z) + \frac{1}{n+1} [L(X, Y) - L(Y, X)]Z + \sum_{m=1}^{n} [L(X, Y)Y - L(Y, Z)Y] + \frac{1}{n+1} [L(Z, X)Y - L(Z, Y)X] \]

It can be shown that symmetric connexion which are projectively related have the same curvature tensor.

The weyl's projective curvature tensor w satisfies the following properties:-

i. \( W(X, Y, Z) = -W(Y, X, Z) \)

ii. \((trW)(X, Y) = (C_3'W)(X, Y) = 0\)

iii. \( W(X, Y, Z) + W(Y, Z, X) + W(Z, X, Y) = 0 \)

1.3 Literature review

Set of new curvature tensors was defined on the line of Weyl tensor by Pokhariyal and Mishra (1970), and Pokhariyal (1979); to study Relativistic significance of curvature tensors. The Weyl's projective curvature tensor was defined on the basis of geodesic correspondence due to a particular type of distribution of vector fields contained in it.

These new tensors were not necessary due to its in variance in two spaces \( V_n \) and \( \overline{V_n} \), but showed that the "distribution" (order in which the vectors in question are arranged before being acted upon by the tensor in question), of vector field over the metric potentials and matter tensors plays an important role in shaping the various physical and geometrical properties of a tensor, viz the formulation of gravitational waves, reduction of electromagnetic field to a purely electric field, vanishing of the contracted tensor in an Einstein space and the cyclic property. The relativistic significance of Weyl's projective curvature tensor has also been explored by Singh (1965).
The concept of curvature is very common in Differential Geometry. In this article we try to show its evolution along history, as well as some of its applications. This survey is limited both in number of topics dealt with and the extent with which they are treated. Some of them, like minimal submanifolds, Kahler manifolds or Morse Theory are completely omitted. Though in an implicit way, the curvature is already present in the Fifth Euclid’s Postulate.

However it does not emerge explicitly in Mathematics until the appearance of the theory of curves and surfaces in the euclidean space. Taking basically the work of Gauss’s as a starting point, Riemann defines the curvature tensor in an abstract and rigorous way.

The introduction of multilinear algebra in the second half of the XIX century allowed a better analytic formulation and its further development. It is worth stressing its fundamental role in the development of the Theory of Relativity. Besides, the curvature is present, not only in riemannian manifolds, but also in many other geometric structures, like homogeneous and symmetric spaces, the theory of connections, characteristic classes, etc. Having in mind that the physical world cannot be explained in a linear way, the curvature also arises in the theories of Mathematical Physics. Likewise, it seems interesting to note its presence in applied sciences, like Estereology.

The world we live in, and the mathematical models describing the geometrical and physical objects, cannot be properly explained with only linear constructions. In order to obtain an adequate description of Nature, it is necessary to introduce models in which the relations between parameters go beyond the linear ones. That is why the concept of curvature appears in a natural way.

According to Osserman, the notion of curvature is one of the main concepts of differential geometry; it could be argued that it is indeed the central one, by distinguishing the geometrical core of the subject from those aspects that are analytic, algebraic or topological. According to Berger, the curvature is the most important invariant of Riemann’s Geometry, and the most natural one. In Gromov writes: “the curvature tensor of a Riemann manifold is a little monster of multilinear algebra whose complete geometrical meaning remains obscure”.

Thus, for Riemannian manifolds without additional structures, the curvature is a complicated magnitude. Its properties in the simplest manifolds were the first to be studied. Later, the situation in a more general manifold could be compared to that in the simplest ones.
The latter are often called “model spaces”. The curvature also plays a fundamental role in Physics and other experimental sciences.

For example, the force required to move an object at a constant speed is, according to Newton’s laws, a constant multiple of the curvature of its trajectory; and the movement of a body in a gravitational field is determined, according to Einstein, by the curvature of the space-time.
2 Riemannian and Complex manifold

2.1 Riemannian manifold

2.1.1 Riemannian manifold

Let $T$ be tangent space as at point $P$ of differentiable manifold $V_n$. Let us single out in $V_n$ a real valued bilinear symmetric and positive definite function $g$ on the ordered pair of tangent vectors at each point $P$ on $V_n$. Then $V_n$ is called Riemannian manifold and $g$ is called the metric tensor of $V_n$.

We thus have two vector $X, Y$ of $T$ at $P$

i. $g(X, Y) \in \mathbb{R}$

ii. $g(X, Y) = g(Y, X)$; $g$ is symmetric

iii. $g(aX + bY, Z) = ag(X, Z) + bg(Y, Z)$

iv. $g(X, X) > 0$

v. if $X, Y$ are $C^\infty$ fields with domain $A$ then $g(X, Y)$ at $P$ is a $C^\infty$ function on $A$. Let $(G(X)(Y)) = g(X, Y)$ then $G$ is non singular and Let $-1G$ be the inverse map then $-1GOG = GO^{-1}G = I_n$

The angle $\theta$ between two vectors is defined by

$||X|| ||Y|| \cos \theta = g(X, Y)$

where

$||X|| = g(X, Y)$

Thus two vectors $X$ and $Y$ are perpendicular if $g(X, Y) = 0$

A connexion $D$ is said to be Riemannian if it satisfies

i. $D$ is symmetric
\[ D_X Y - D_Y X = [X, X] \]

ii. \( g \) is covariant constant with respect to \( D \) which gives

\[ D_X g = 0 \]
and
\[ g(D_X Y, Z) + g(Y, D_X Z) = X(g(Y, Z)) \]

An affine connexion \( D \) is said to be metric if \( D_X g = 0 \).

The riemannian manifold is said to be Einsteinian manifold if

\[ Ric(X, Y) = \frac{r}{n} g(X, Y) \]

A Riemannian manifold is said to be flat if

\[ K(X, Y, Z) = 0 \]

The torsion tensor \( Tor \) is vector valued linear function and is defined by

\[ Tor(X, Y) = D_X Y - D_Y X - [X, Y] \]
if torsion vanishes then connexion is said to be torsion free or symmetric

### 2.1.2 Riemannian curvature tensor

The curvature tensor with respect to the Riemannian connexion is called the Riemannian curvature tensor.

Let \( K \) be Riemannian curvature tensor

\[ K(X, Y, Z) = (D_X D_Y - D_Y D_X - D_{X,Y}) Z \]

### 2.1.3 Riemannian connexion

Let \( X \) and \( W \) be vectors as \( P \) in \( R^n \). Let \( Y \) and \( Z \) be \( C^\infty \) field about \( P \) and let \( f \) be a \( C^\infty \) real valued function about \( P \). then we have
Using $\bar{D}$ we can define parallel vector field along a curve and geodesics. Let $r$ be a $\mathcal{C}^\infty$ curve on $\mathbb{R}^n$ with tangent $T$ and let $Y$ be an $\mathbb{R}^n$ vector field that is parallel along $r$ if $\bar{D}_r Y = 0$ along $r$.

The curve $\gamma$ is geodesic if $\bar{D}_\gamma T = 0$ i.e. if its tangent $T$ is parallel along $\gamma$. Thus generalization of a definition of covariant differentiation or connexion on $\mathcal{C}^\infty$ manifold is clear i.e. We merely need the existence of operator $D$ which satisfies all four condition of above properties (2.1.3.1) listed for $\bar{D}$ and assigns to $\mathcal{C}^\infty$ vectors field $X$ and $Y$ with domain $A$, a $\mathcal{C}^\infty$ field $D_X Y$ on $A$.

NB: connexion can be more than one on a given manifold.

Let us denote dot or inner product of $X$ and $Y$ tangent to $\mathbb{R}^n$ by

$$< X, Y > = \sum_{i=1}^{n} X_i Y_i$$

if $X$ and $Y$ are $\mathcal{C}^\infty$ field then $< X, Y >$ is also $\mathcal{C}^\infty$ field and if $A$ is the domain of $X,Y$ and $X Y$ are $\mathcal{C}^\infty$ fields then one easily check that

$$\bar{D}_Y Z - \bar{D}_Z Y = [Y, Z] \text{ on } A$$

(2.1.3.2)

and

$$X_p < Y, Z > = < \bar{D}_X Y, Z > + < Y, \bar{D}_X Z > +$$

(2.1.3.3)

for every $X$ at $p$ in $A$. From above we can generalize and fix some terms.

\begin{enumerate}
  \item $D_X (Y + Z) = D_X Z + D_Y Z$
  \item $D_{X+W}(Y) = D_X Y + D_W Y$
  \item $D_{f(p)}Y = f D_X Y$
  \item $D_X (f Y) = (X f) Y_p + f(p) D_X Y$
\end{enumerate}

(2.1.3.1)
A Riemannian manifold is a $c^\infty$ manifold $M$ on which one has singled out a $c^\infty$ real valued, bilinear, symmetric and positive define function $<,>$ on ordered pair of tangent vector at each point. Thus if $X,Y$ and $Z$ are in $M_P$ then $X,Y$ is real number and $<,>$ satisfies the following properties

i. $<X,Y> = <Y,X>$ symmetric

ii. $<X+Y,Z> = <X,Z> + <Y,Z>$ bilinear

$<aX,Y> = a <X,Y>$ for all $a \in \mathbb{R}$

iii. $<X,X> > 0$ for all $X \neq 0$

iv. If $X$ and $Y$ are $c^\infty$ fields with domain $A$ then $<X,Y>_p = <X_p,Y_p>$ is a $c^\infty$ function on $A$ when (3) is placed by (3*) (non singular) $<X,Y>_p = 0$ for all $X$ implies $Y=0$ then $M$ is semi-Riemannian (or pseudo Riemannian) manifold. In either case the function is inner product, metric tensor, the Riemannian metric or infinite semi metric on $M$ not the topological metric function.

If $D$ is $c^\infty$ connexion in semi-Riemannian manifold $M$ then $D$ is Riemannian connexion if it satisfies (2.1.3.2) and (2.1.3.3)

2.1.4 Properties of Riemannian curvature tensor

The Riemannian curvature tensors is linear over the ring of smooth function are coefficient on the right hand side and satisfy the following properties

i. $K(X,Y,Z) = -K(Y,X,Z)$

and if $f$ is smooth function then

ii. $K(fX,Y,Z) = -fK(Y,X,Z)$ where $D$ is Riemannian connexion.

Let us define

$'K(X,Y,Z,W) = g(K(X,Y,Z),W)$

then $'K$ is skew symmetric in the first two slots and the last two slots. The Riemannian curvature tensor $K$ satisfies Binachi’s first identity and Bianchi’s second identity.
Curvature Tensors

In a Riemannian manifold the weyl projective tensor reduces to

\[ W(X, Y, Z) = K(X, Y, Z) + \frac{1}{n-1} [Ric(X, Z)Y - Ric(Y, Z)X] \]

Conformal curvature tensor

The tensor \( V \) defined by

\[ V(X, Y, Z) = \]

\[ K(X, Y, Z) + \frac{1}{n-2} [Ric(Y, Z)X - Ric(X, Z)Y - g(X, Z)RY + g(Y, Z)RX] + \]

\[ \frac{r}{(n-1)(n-2)} [g(Y, Z)X - g(X, Z)Y] \]

is same for manifolds in conformal correspondence. This tensor is called the conformal curvature tensor.

A manifold whose conformal curvature tensor vanishes at every point is said to be conformal flat. A conformal curvature \( V \) satisfies Bianchi’s first identity

\[ V(X, Y, Z) + V(Y, Z, X) + V(Z, X, Y) = 0 \]

Concircular curvature tensor

The concircular curvature tensor is defined by

\[ C(X, Y, Z) = K(X, Y, Z) - \frac{r}{n(n-1)} [g(Y, Z)X - g(X, Z)Y] \]

Conharmonic curvature tensor

The conharmonic curvature tensor is defined by

\[ L(X, Y, Z) = K(X, Y, Z) - \frac{1}{n-2} [Ric(Y, Z)X - Ric(X, Z)Y + g(Y, Z)RX - g(X, Z)RY] \]

Riemannian curvature

Let \( X \) and \( Y \) be unit tangent vector at a point \( P \) of Riemannian manifold \( V_n \), these vectors determine a pencil of direction at \( P \) if the unit vectors along that
direction are U then

\[ U = fX + gY, \text{where } f, g \in \mathbb{F} \]

and

\[ f^2 + g^2 = 1 \]

the geodesic of \( V_n \) whose unit tangent vector are \( U \), generate a two dimensional sub manifold of the tangent manifold \( T \) at \( P \).

The gaussian curvature \( K(X, Y) \) at \( P \) of this two dimensional sub manifold was defined by Riemannian as sectional curvature at \( P \) of \( V_n \) in direction of \( X \) and \( Y \). Thus

\[ K = \frac{-K(X, Y, X) - K(X, Y, Y)}{\|X\|^2 \|Y\|^2 [1 - \cos^2 \theta]} \]

where \( \theta \) is angle between \( X \) and \( Y \).

A necessary and sufficient condition on \( V_n \) to be locally flat in the neighbourhood \( U \) of a point \( P \) is that Riemannian curvature of \( V_n \) at \( P \) vanishes.

If the Riemannian curvature \( K \) of \( V_n \) at \( P \) of the direction \( X \) and \( Y \) then

\[ K(X, Y, Z) = K[g(Y, Z)X - g(X, z)Y] \quad \text{.........(*)} \]

contracting we get

i. \( \text{Ric} = K(n-1)g \)

ii. \( \text{R} = [K(n-1)]n \quad \text{.........(**)} \)

contracting (ii) we get

\( \text{R} = Kn(n-1) \)

hence a Riemannian manifold of constant curvature is an Einstein manifold.

**Shur’s theorem**

If a Riemannian curvature \( K \) of \( V_n \) at every point of neighborhood \( U \) of \( V_n \) is independent of the direction chosen then \( K \) is constant throughout the neighborhood \( U \) provided \( n > 2 \) putting (*) and (**) together we get \( W = 0 \)
Conversely, if \( W = 0 \)

\[
K(X,Y,Z) = \frac{1}{n-1} [g(Y,Z)RX - g(X,Z)RY]
\]

corresponding equation we get

\[
Ric(Y,Z) = \frac{r}{n} g(Y,Z)
\]

which sometimes expressed as \( RX = \frac{r}{n} X \) and putting the two equation into the first one we get

\[
K(X,Y,Z) = \frac{r}{n(n-1)} [g(Y,Z)X - g(X,Z)Y]
\]

which shows that a manifold is constant Riemannian curvature. Hence a necessary and sufficient condition for the manifold \( V_n \) to be of constant Riemannian curvature is not the Weyl projective curvature tensor vanishes identically throughout \( V_n \).

Similarly the conformal curvature tensor vanishes from manifold with constant Riemannian curvature.

### 2.1.5 Difference tensor of two connections

Consider a smooth manifold \( M \) and let \( D \) and \( \overline{D} \) be two connexion on \( M \) for two field \( X \) and \( Y \) on \( M \). We define difference tensor by

\[
B(X,Y) = D_X Y - \overline{D}_X Y
\]

Linearity of \( B \) slot is trivial result from properties of connexion and let us consider slot 2.

Let \( f \) be \( c^\infty \) on domain \( X \) and \( Y \) then

\[
B(X,fY) = (Xf)Y + fD_X Y - (Xf)Y - fD_X Y = fB(X,Y)
\]

If we decomposed \( B(X,Y) \) into symmetric and skew symmetric pieces we have;

Lets \( B(X,Y) = S(X,Y) + Z(X,Y) \)

where \( S(X,Y) = \frac{1}{2} [B(X,Y) - B(Y,X)] \) (symmetric part)

and

\[
A(X,Y) = \frac{1}{2} [B(X,Y) - B(Y,X)] \text{(skew symmetric part)}
\]
Then we can express $A$ in terms of torsion tensors $T$ and $\bar{T}$ of connexion $D$ and $\bar{D}$ respectively as for

$$2A(X,Y) = B(X,Y) - B(Y,X)$$

$$= D_X Y - D_Y X - D_Y X - D_Y X$$

$$= \bar{T}(X,Y) - T(X,Y) + [X,Y] - [X,Y]$$

$$= \bar{T}(X,Y) - T(X,Y)$$

**Theorem**

The following statements are equivalent

i. The connexion $D$ and $\bar{D}$ have same geodesic
ii. $B(X,X) = 0$ for all vector $X$
iii. $S = 0$
iv. $B = A$

Proof omitted

**Theorem**

The connexion $D$ and $\bar{D}$ are equal if they have the same geodesic and the same torsion tensors.

**Proof**

That the first part implies the second is trivial. Conversely, if the geodesic are the same then $S = 0$ and if the torsion tensors are equal then $A = 0$; hence $B = 0$ and $D = \bar{D}$

2.1.6 **Riemannian curvature tensor**

The curvature tensor of connexion $D$ is a linear transformation valued tensor $R$ that assigns to each pair of vector $X$ and $Y$ at linear transformation $R(X,Y)$ of $M_n$ into itself. We define $R(X,Y)Z$ by imbedding $X,Y$ and $Z$ in $c^\infty$ field about $M$ and setting

$$R(X,Y)Z = (D_X D_Y Z - D_Y D_X Z - D_{[X,Y]} Z)_m$$

(2.1.5.1)
Hence we notice that $R(X,Y) = -R(Y,X)$ and if $f$ is $C^\infty$ then

$$R(fX,Y)Z = fD_XD_YZ - (Y f)D_XZ - fD_YD_XZ + (Y f)D_XZ - fD_{X,Y}Z =$$

$$= fR(X,Y)Z$$

(2.1.5.2)

also

$$R(X,Y)(fZ) = D_X(Y f)X + fD_YZ - D_Y([X,Y] f)Z - fD_{[X,Y]}Z$$

$$= (Y f)D_XZ + (X f)D_YZ + fD_XD_YZ - (Y f)D_YZ - (X f)D_YZ - (Y f)D_XZ$$

$$- fD_YD_XZ - ([X,Y] f)Z - fD_{[X,Y]}Z$$

$$= fR(X,Y)Z$$

(2.1.5.3)

The linearlity of $R(X,Y)Z$ with respect to addition (in each slot) is trivial to check. The curvature of symmetric linear connexion on $M$ satisfies Bianchi identities

$$R(X,Y)Z + R(Y,Z)X + R(Z,X)Y = 0$$

(2.1.5.4)

for all vector $X,Y,Z$ in $M$ for which the left hand side is defined to prove this, we recall that for symmetric connexion

$$D_A B - D_B A = [a,b]$$

$$R(X,Y)Z + R(Y,Z)X + R(Z,X)Y =$$

$$= [X, [Y, Z]] + [Y, [Z, X]] + [Z, [X, Y]] = 0$$

By Jacobi identity.

if we define
\[ Z < X, Y > = < D_Z X, Y > + < X, D_Z Y > \]

(2.1.5.5)

for all vector \(X, Y, Z\) with common domain, then using about definition we can define a 4 rank covariant tensor called Riemann-Christoffel curvature tensor as

\[ K(X, Y, Z, W) = < X, R(Z, W)Y > \]

(2.1.5.6)

for all \(X, Y, Z\) and \(W\) is same domain.

Thus from the above definition the following result arises

i. \(K(X, Y, Z, W) = -K(Y, X, Z, W)\)

ii. \(K(X, Y, Z, W) = -K(X, Y, W, Z)\)

iii. \(K(X, Y, Z, W) = K(Z, W, X, Y)\)

(2.1.5.7)

**Theorem**

Let \(M\) be differential i.e. Riemannian n-manifold. Then there is unique torsion free connexion \(D\) such that \(D\) on \(M\) satisfies

i. \(D\) is symmetric

ii. \(D_X g = 0\) for all \(X \in T(M)\).

parallel translation preserves inner products, this connexion is called the Riemannian or Levi-civita connexion.
Proof

Uniqueness from proposition (2.1.5.3) we obtain

\[ Xg(Y,Z) - g(D_X Y, Z) - g(Y, D_X Z) = 0 \]

using D is torsion free this yields

i. \( Xg(Y,Z) = g(D_X Y, Z) \)

\[ = g([X,Y],Z) + g(Y,D_X Z) \]

cyclically permuting X,Y and Z we get

ii. \( Yg(Z,X) = g(D_X Y, X) + g([Y,Z],X) + g(Z,D_Y X) \)

iii. \( Zg(X,Y) = g(D_X Z, Y) + g([Z,X],Y) + g(X,D_Z Y) \)

substituting (i) from (ii)+(iii) we get

\[ 2g(D_Z Y, X) = -X < Y, Z > + Y < Z, X > + Z < X, Y > - < [Z,X], Y > - < [Y,Z], X > \]

the right hand of this last expression does not involve D, so we have a formula for \( g(D_Z Y) \) on X. As \(<,>\) is non singular i.e

The map \( T(M) \ldots \cdot T^*(m) \) induced by g being an isomorphism and X is arbitrary, \( D_Z Y \) is uniquely determined so D is unique.

If we define \( D_Z Y \) by using the expression 2g above then D is a connexion and we find condition (i) and (ii) of the theorem satisfied.

Q.E.D

2.2 Complex Manifold

2.2.1 Complex Manifold

An even dimensional differentiable manifold \( V_n; n=2m \) which can be endowed by a system of complex coordinate neighborhood \((U, \alpha)\) in such a way that in
the intersection $UnU'$ of two complex coordinate patches $(U, \alpha), (U', \alpha'), \alpha'$ are complex analytic function of $\alpha$ is called a complex manifold.

2.2.2 Almost complex manifold

If on an even dimensional differentiable manifold $V_n: n=2m$ of differentiability class $C^{r+1}$ there exist a vector valued real linear function $f$ of differentiability class $C^r$ satisfying

i. $F^2 + I_n = 0$

which implies

ii. $\bar{X} + X = 0$ where $\bar{X} = FX$

then $V_n$ is said to be an almost complex manifold and $f$ is said to be an almost complex structure $V_n$. We shall apply the following notation

i. The operation of premultiplying a vector by $F$ will be known as barring the vector.

ii. we shall denote $T(V_n)$ the set of $C^\infty$ vector field of $V_n$.

iii. in this and what follows the equation containing $X, Y, Z, \ldots$ hold for arbitrary vectors fields $X, Y, Z, \ldots \in T(V_n)$ unless explicitly stated otherwise.
3 Sasakian manifold

3.1 The $w_6$ curvature tensor

Weyl’s projective curvature tensor is given by

$$W(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(X, Z)Ric(Y, U) - g(X, U)Ric(Y, Z)]$$

The other tensors have been defined by (Pokhariyal and Mishra)(1970, 1982) are given by

$$W_1(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(X, U)Ric(Y, Z) - g(Y, U)Ric(X, Z)]$$

$$W_2(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(X, Z)Ric(Y, U) - g(Y, Z)Ric(X, U)]$$

$$W_3(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(Y, Z)Ric(X, U) - g(Y, U)Ric(X, Z)]$$

$$W_4(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(X, Z)Ric(Y, U) - g(X, Y)Ric(Z, U)]$$

$$W_5(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(X, Z)Ric(Y, U) - g(Y, U)Ric(X, Z)]$$

For $W_6$ which is studied in this project is given by

$$W_6(X, Y)Z = R(X, Y)Z + \frac{1}{n-1}[g(X, Z)Y - XRic(Y, Z)]$$

$$W_6(X, Y, Z, U) = R(X, Y, Z, U) + \frac{1}{n-1}[g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z)]$$

Which is from the following definition

**Definition**

In a (2n+1) dimensional Riemannian manifold $M$ the $\tau$-curvature tensor is given by Tripathi and Gupta(2011)

$$T(X, Y)Z = a_0R(X, Y)Z + a_1S(Y, Z)X + a_2S(X, Z)Y + a_3S(X, Y)Z + a_4g(Y, Z)QX + a_5g(X, Z)QY + a_6g(X, Y)QZ + a_7r(g(Y, Z)X - g(X, Z)Y) \ldots \ldots \ldots(*)$$

where $R$ is curvature tensor,$S$ is ricci tensor,$Q$ is Ricci operator and $r$ is scalar curvature.
we thus break the equation into symmetric P and skew symmetric Q parts in X and Y.

We start with symmetric part P

\[ P(X, Y, Z, U) = \frac{1}{2} [W_6(X, Y, Z, U) + W_6(Y, X, Z, U)] \]

\[ \begin{aligned} & = \frac{1}{2} \left[ R(X, Y, Z, U) + \frac{1}{n-1} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z)] \right] + \frac{1}{n-1} [g(Y, X)Ric(Z, U) - g(Y, U)Ric(X, Z)] \\ & = \frac{1}{2} \left[ R(X, Y, Z, U) + \frac{1}{2(n-1)} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z)] + g(Y, X)Ric(Z, U) - g(Y, U)Ric(X, Z) \right] \\ & = \frac{1}{2(n-1)} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z) + g(Y, X)Ric(Z, U) - g(Y, U)Ric(X, Z)]. \end{aligned} \]

or (1.13) \[ P(X, Y, Z, U) = \frac{1}{2(n-1)} [2g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z) - g(Y, U)Ric(X, Z)]. \]

now we take a look at skew-symmetric part Q

\[ Q(X, Y, Z, U) = \frac{1}{2} [W_6(X, Y, Z, U) - W_6(Y, X, Z, U)] \]

\[ \begin{aligned} & = \frac{1}{2} \left[ R(X, Y, Z, U) + \frac{1}{n-1} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z)] \right] - \frac{1}{n-1} [g(Y, X)Ric(Z, U) - g(Y, U)Ric(X, Z)] \\ & = \frac{1}{2} \left[ R(X, Y, Z, U) - \frac{1}{2(n-1)} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z)] + g(Y, X)Ric(Z, U) + g(Y, U)Ric(X, Z) \right] \\ & = \frac{1}{2(n-1)} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z) - g(Y, X)Ric(Z, U) + g(Y, U)Ric(X, Z)]. \end{aligned} \]

or (1.14) \[ Q(X, Y, Z, U) = \frac{1}{2(n-1)} [g(X, Y)Ric(Z, U) - g(X, U)Ric(Y, Z) + g(Y, X)Ric(Z, U) - g(Y, U)Ric(X, Z)]. \]

2.LP-Sasakian manifold

In this section we study properties of \( W_6, P, q \) curvature tensors in LP-sasakian
Theorem 2.1
In an n-dimensional LP-Sasakian manifold we have

i. \( W_6(T, Y, Z, T) = -g(Y, Z) + \frac{1}{n-1} \text{Ric}(Y, Z) \)

ii. \( W_6(X, Y, T) = YA(X) \frac{2-n}{n-1} \)

iii. \( W_6(T, Y, T) = Y \frac{n-2}{n-1} \)

Proof (2.1)i
Putting \( U=T \) in (1.12) we get

\( W_6(X, Y, Z, T) = R(X, Y, Z, T) + \frac{1}{n-1} [g(X, Y) \text{Ric}(Z, T) - g(X, T) \text{Ric}(Y, Z)] \)

Using (1.4) we get

\( W_6(X, Y, Z, T) = R(X, Y, Z, T) + \frac{1}{n-1} [g(X, Y) \text{Ric}(Z, T) - A(X) \text{Ric}(Y, Z)] \)

Using (1.9) we get

\( W_6(X, Y, Z, T) = g(Y, Z) A(X) - g(X, Z) A(Y) + \frac{1}{n-1} [g(X, Y) \text{Ric}(Z, T) - A(X) \text{Ric}(Y, Z)] \)

Using (1.10) we get

\( W_6(X, Y, Z, T) = g(Y, Z) A(X) - g(X, Z) A(Y) + \frac{1}{n-1} [g(X, Y) (n-1) A(Z) - A(X) \text{Ric}(Y, Z)] \)

\( = g(Y, Z) A(X) - g(X, Z) A(Y) + g(X, Y) A(Z) - A(X) \frac{1}{n-1} \text{Ric}(Y, Z) \)

Putting \( X=T \) in (2.2) we get

\( W_6(T, Y, Z, T) = g(Y, Z) A(T) - g(T, Z) A(Y) + g(T, Y) A(Z) - A(T) \frac{1}{n-1} \text{Ric}(Y, Z) \)

Using (1.1), we get

\( W_6(T, Y, Z, T) = -g(Y, Z) - g(T, Z) A(Y) + g(T, Y) A(Z) + \frac{1}{n-1} \text{Ric}(Y, Z) \)

Again using (1.4), we get...
'W_6(T, Y, Z, T) = -g(Y, Z) - A(Z)A(Y) + A(Y)A(Z) + \frac{1}{n-1}Ric(Y, Z) \\
&W_6(T, Y, Z, T) = -g(Y, Z) + \frac{1}{n-1}Ric(Y, Z) \text{.....Hence proved} \\

Proof (2.1)ii \\
&W_6(X, Y, Z, U) = g(W_6(X, Y, Z), U) \text{ and (1.12) we have} \\
&W_6(X, Y, Z) = R(X, Y, Z) + \frac{1}{n-1}[g(X, Z)Y - X Ric(Y, Z)] \\

Putting T=Z \\
&W_6(X, Y, T) = R(X, Y, T) + \frac{1}{n-1}[g(X, T)Y - X Ric(Y, T)] \\

Using XA(Y)-YA(X) and (1.4)(1.10) we get \\
&W_6(X, Y, T) = XA(Y) - YA(X) + \frac{1}{n-1}[A(X)Y - X(n-1)A(Y)] \\
&W_6(X, Y, T) = XA(Y) - YA(X) + \frac{1}{n-1}A(X)Y - XA(Y) \\
&W_6(X, Y, T) = -YA(X) + \frac{1}{n-1}A(X)Y \\
&W_6(X, Y, T) = YA(X) \frac{2-n}{n-1} \text{..................Hence proved} \\

Proof (2.1)iii \\
Putting X=T in (2.1)ii we get \\
&W_6(T, Y, T) = YA(T) \frac{2-n}{n-1} \\

Using (1.1) we get \\
&W_6(T, Y, T) = -Y \frac{2-n}{n-1} \\
&W_6(T, Y, T) = Y \frac{n-2}{n-1} \text{..................Hence proved} \\

Theorem 2.2 \\
In an n-dimensional LP-Sasakian manifold P tensor field satisfies \\
i. 'P(X, Y, Z, T) = g(X, Y)A(Z) - \frac{1}{2(n-1)}[A(X)Ric(Y, Z) + A(Y)Ric(X, Z)]
ii. \[ P(T,Y,Z,U) = -\frac{1}{2} g(Y,U)A(Z) + \frac{1}{2(n-1)} [2A(Y)Ric(Z,U) - A(U)Ric(Y,Z)] \]

iii. \[ P(T,Y,Z,T) = \frac{1}{2} [A(Y)A(Z) + \frac{1}{n-1}Ric(Y,Z)] \]

**Proof (2.2)i**

Using (1.13) and putting T=U we have

\[ P(T,Y,Z,T) = \frac{1}{2(n-1)} [g(X,Y)Ric(Z,T) - g(X,T)Ric(Y,Z)] + g(Y,X)Ric(Z,T) - g(Y,T)Ric(X,Z) \]

Using (1.4) and (1.10) we get

\[ = \frac{1}{2(n-1)} [g(X,Y)(n-1)A(Z) - A(X)Ric(Y,Z)] + g(Y,X)(n-1)A(Z) - A(Y)Ric(X,Z) \]

\[ = \frac{1}{2} [g(Y,X)A(Z) + g(Y,X)A(Z)] - \frac{1}{2(n-1)} [A(X)Ric(Y,Z)] - A(Y)Ric(X,Z) \]

\[ = g(Y)A(Z) - \frac{1}{2(n-1)} [A(X)Ric(Y,Z) + A(Y)Ric(X,Z)] \ldots \text{Hence proved} \]

**Proof (2.2)ii**

Using (1.13) and putting T=X we have

\[ P(T,Y,Z,U) = \frac{1}{2(n-1)} [2g(T,Y)Ric(Z,U) - g(T,U)Ric(Y,Z) - g(Y,U)Ric(T,Z)] \]

Using (1.4) and (1.10) we have

\[ P(T,Y,Z,U) = \frac{1}{2(n-1)} [2A(Y)Ric(Z,U) - A(U)Ric(Y,Z) - g(Y,U)(n-1)A(Z)] \]

\[ P(T,Y,Z,U) = -\frac{1}{2} g(Y,U)A(Z) + \frac{1}{2(n-1)} [2A(Y)Ric(Z,U) - A(U)Ric(Y,Z)] \ldots \text{Hence proved} \]

**Proof (2.2)iii**

Putting X=T in (2.2)i we get

\[ P(T,Y,Z,T) = g(T,Y)A(Z) - \frac{1}{2(n-1)} [A(T)Ric(Y,Z) + A(Y)Ric(T,Z)] \]

Using (1.1),(1.4) and (1.10) we have

\[ P(T,Y,Z,T) = A(Y)A(Z) - \frac{1}{2(n-1)} [-Ric(Y,Z) - A(Y)(n-1)A(Z)] \]

\[ P(T,Y,Z,T) = A(Y)A(Z) - \frac{1}{2} A(Y)A(Z) + \frac{1}{2(n-1)}Ric(Y,Z) \]
Theorem 2.3
In an n-dimensional LP-Sasakian manifold Q tensor field satisfies

\[ Q(X, Y, Z, T) = A(X)[g(Y, Z) - \frac{1}{2(n-1)}Ric(Y, Z)] - \frac{1}{2(n-1)}Ric(X, Z) \]

\[ Q(T, Y, Z, U) = A(U)[g(Y, Z) - \frac{1}{2(n-1)}Ric(Y, Z)] - \frac{1}{2}g(Y, U)A(Z) \]

\[ Q(T, Y, Z, T) = -g(Y, Z) + \frac{1}{2}[\frac{1}{n-1}Ric(Y, Z) - A(Y)A(Z)] \]

Proof (2.3)i
Using (1.14) and putting T=U we have

\[ Q(X, Y, Z, T) = R(X, Y, Z, T) - \frac{1}{2(n-1)}[g(X, T)Ric(Y, Z)] - g(Y, T)Ric(X, Z) \]

Using (1.4),(1.9) we have

\[ Q(X, Y, Z, T) = g(Y, Z)A(X) - g(X, Z)A(Y) - \frac{1}{2(n-1)}[A(X)Ric(Y, Z)] - A(Y)Ric(X, Z) \]

\[ Q(X, Y, Z, T) = A(X)[g(Y, Z) - \frac{1}{2(n-1)}Ric(Y, Z)] - A(Y)[g(X, Z) - \frac{1}{2(n-1)}Ric(X, Z)] \]

Hence proved

Proof (2.3)ii
Using (1.14) and putting T=X we have

\[ Q(T, Y, Z, U) = R(T, Y, Z, U) - \frac{1}{2(n-1)}[g(T, U)Ric(Y, Z)] - g(Y, U)Ric(T, Z) \]

Using (1.4),(1.9),(1.10) we have

\[ Q(T, Y, Z, U) = g(Y, Z)A(U) - g(Y, U)A(Z) - \frac{1}{2(n-1)}[A(U)Ric(Y, Z)] - g(Y, U)(n-1)A(Z) \]

\[ Q(T, Y, Z, U) = A(U)[g(Y, Z) - \frac{1}{2(n-1)}Ric(Y, Z)] - \frac{1}{2}g(Y, U)A(Z) \]

Hence proved

Proof (2.3)iii
Let X=T in (2.3)i
\[ 'Q(T,Y,Z,T) = A(T)[g(Y,Z) - \frac{1}{2(n-1)} Ric(Y,Z)] - A(Y)[g(T,Z) - \frac{1}{2(n-1)} Ric(T,Z)] \]

Using (1.1), (1.9), (1.10) we have

\[ 'Q(T,Y,Z,T) = -[g(Y,Z) - \frac{1}{2(n-1)} Ric(Y,Z)] - A(Y)[A(Z) - \frac{1}{2(n-1)} (n-1) A(Z)] \]

\[ 'Q(T,Y,Z,T) = -g(Y,Z) + \frac{1}{2(n-1)} Ric(Y,Z) - A(Y)[A(Z) + \frac{1}{2} A(Y) A(Z) \]

\[ 'Q(T,Y,Z,T) = -g(Y,Z) + \frac{1}{2} [\frac{1}{n-1} Ric(Y,Z) - A(Y) A(Z)] \]......Hence proved
