etc.

Your obedient servant,

~~John A. S. Webb,
ASSISTANT SECRETARY~~

much against, this officer was given injections of quinine di-hydrochloride in all his attacks of Malaria with good results.

In none of the cases treated with injections was there any sign of abscess formation, beyond a certain amount of soreness after the injection for a day or so the patients made no after complaints. The site chosen for the injection was in the elbow high up in the fleshy part of the deltoid.

I am perfectly convinced that there is very little danger to be feared from Quinine Injections if all aseptic precautions be taken and the drug used comes from a reliable firm, such as the Di-Hydrochloride supplied in sterilized capsules by Burroughs Wellcome & Co. and my dose up to 30 c.c. can be given with safety, and, that the drug is absorbed your patient will very soon let you know.

In conclusion I might add that in all the cases I have reported as Blackwater Fever, which I have no doubt were of Malarial origin, Quinine apparently formed the main part of the treatment and out of 4 cases I had one death in which case suppression of urine and Uremia supervened, while the others made very good recoveries, however after the injections of quinine no malarial parasites could be found in the peripheral circulation although no quinine had been given by the mouth, which also confirms that the Quinine had been absorbed.

In India there is an Amy regulation forbidding the use of injections of quinine, as nine deaths were reported from Arsenical poisoning following the administration of the drug but this need not be feared as I

given by the nurse, but this soon caused him to vomit again and he brought up a large quantity of bright colored blood. He was then given an injection of Quinine and also an injection of Morphine and Atropine, after an hour when his condition was better, a blood smear was taken and counts were recorded. His spleen was very much enlarged due to repeated attacks of malaria. Given an injection of Quinine 24 Grm. & 15 Intramuscularly. Another injection of Quinine 25 Grm. & 15 was given in the evening. In this a good recovery, the vomiting and retching stopped after he was given the Morphine and Quinine. After administration he had an headache but this might have been due to the action of the Morphine. This was only the case in which Quinine or Quinine was injected as I had one out of my stock of Malaria-capsule, and I am glad to say with no ill effects.

Of recent years there have been many controversies regarding the giving of Quinine Intramuscularly, and it would seem as we do strongly appeal to the Army being given Intramuscularly with the belief that the drug is best absorbed in the blood, with the very interesting results obtained by us after giving the Subcutaneously of Quinine Intramuscularly (in so case you do give Intramuscularly). I am very much convinced that this is not the case, at least in our part as far as our men, that the drug was absorbed by the Thomas to explain by the fact that the patients complained of diarrhea and passing out of the body when they do these were after the injection although no Quinine had been given by the nurse. Our Surgeon Officer would not take Quinine by the mouth during his tropical tour, - without or which I am now

my notice, one child that was not treated by quinine apparently died on the third day of the disease, while the other two who were in a worse condition recovered after injections of quinine. One of these cases I reported to you Dr. [unclear] Birkett never came to Altonness for similarity to Birkett never, complete found in the blood in each case.

Nearly all the cases of Malaria which occurred at Sennar during the Malaria season came under the heading (1) involving 3 European officers, in which the acute symptoms, of severe pain and vomiting were very marked and in these cases, a small dose of T. chloroform or Morphine or Acid Salicyclic acid was given for the vomiting when Morphine was injected in some cases; and quinine 15-granules twice in doses of 10cc. I was given immediately. Quinine was not given until Malaria parasites were demonstrated in the blood. In most of these cases spores were found and in others a mixed infection. Injections were given in some cases twice daily and in others 3 times daily, until the acute symptoms had passed off and then quinine was given up the mouth.

Under the heading (2) the cases were under my care, with 1999 cases over and the number of blood lost before the patients came under treatment too remarkable. In these cases also a history of Malaria was present and blood counts peculiar peripheries, a case was affected in 8 days due to injections of Morphine for the diarrhoea, and injections of quinine one of these cases I could mention.

Present a Malaria, aged 18 was brought to hospital with a history of continuous regular quotidian of 7 days and passed blood to hisorrhoids more 1,000 cubic cm. in a state of collapse and fainting and vomiting were

SURGEON.

10th Aug 1955.

~~Refugee Hospital No. 302~~.

The Principal Medical Officer,

L.A.M.D.

RE:

I have the honor to state that during the present epidemic of Malaria at Derauli injections of quinine were extensively employed by me. In all about 100 injections were given, all with very good results. The cases in which I consider that quinine should be given by injection, either intramuscularly or subcutaneously are those certain cases of Subacute Malaria in which the parasitic count seems to have been prolonged by the parasite and in which cases the patient must be brought under the influence of quinine as rapidly as possible; these cases are:-

- (a) Malaria FEVER with marked Thrombocytopenia such as ~~Paroxysms &~~ Fever.
- (b) Malaria FEVER with severe paroxysmal symptoms such as ~~paroxysms terminating in which~~ quinine cannot be administered orally.
- (c) Malaria accompanied with haemorrhage from the bowels and Haematuria.
- (d) Malaria with subacute anaemia (haemolytic), during the epidemic cases falling under these four headings were under my care. These being under the heading (a) I injected and on about half cases under

my notice

Cases of Malaria FEVER
Treated by Injections of Quinine.

a. Hilie Askeri. This man arrived from Lybia in a unknown condition unaccompanied by any information about his illness or the duration. His spleen was enlarged and he had a few moist sounds at the base of one lung. His temperature was 100° and pulse 110. A blood examination revealed the presence of Subtertian Parasites, and an injection of quinine was given at once. This never had to be repeated as the patient was recovered next day, with a temperature of 98° , and for the rest of his stay in Hospital he took quinine by mouth.

Battalion R.F.T. 1902, L.M.C.

Re. G/L 1.

Health Office

El Paso,

May 20th, 1918.

Case III. Two injections of quinine of 10 grs. each were given within 12 hours of admission, no parasites were found to be very numerous and temperature high 102°. Fifteen 24 hours of admission the temperature was almost normal.

Case IV. Headache, jaudiced, vomiting and urine coctailed with reference to Malaria. Parasites were not found on first examination so that quinine was not given. A few hours later became comatose, and appeared to certainly ill, an injection of quinine was given and repeated later resulting in fairly rapid improvement. Malarial parasites were found to be numerous in blood slides taken later.

Dr. A. Scott.

Health Office of Health.

received a dose proportional to his greatest age, which dose was repeated in the morning about 18 hours after, when he was found to be cheerful and apparently recovered; after second injection no parasites could be found and the cure was completed by quinine by mouth.

I have frequently found that in cases which had failed to yield satisfactorily to quinine by mouth both in tablets and solution a few injections had a very marked effect upon symptoms.

I have never seen any ill effects from injections given by mouth.

(8)

I have the honor to be,

Very,

Your obedient servant,

Dr. A. Gossell,
Medical Officer of Health.

The Principal Medical Officer,
S.A.P.

Re. 36/36.

Health Office,

Kandahar,

9th May, 1918.

15

Sir,

I am convinced from my experience that the intramuscular is the most efficient and least unpleasant method of vaccine administration not only from a sanitary but also a prophylactic point of view.

I have, as you are aware, been for some years disengaged from hospital or private practice and can give no recent examples to support of my views except in my own case.

The following however I can guarantee.

Sir. J., an Indian Engineer on the Paka river steamer. This was one of the first occasions on which I used this method in the winter part of 1908.

The patient had had several attacks of "fever" and when I saw him he had ~~haemophilic~~ a very high temperature and was very ill. Paroxysms, sweating, were present in full measure. He received gr. 3 at once and 12 hours later the fever was repeated.

After the first injection the haemophilic gradually disappeared and by the evening had quite cleared up. Thirty six hours after the first injection I failed to find any paroxysm in the blood and the patient continued himself quite fit.

Sir. J., a small child was brought to Hospital at Kandahar. When seen was unconscious and had a very high temperature, a blood slide was examined on the spot and found to be positive with sulphuric rings, i.e.

| Blood count. | 45 | 31 | 13 | 1 | 0 |

had four injections on consecutive days and quinine grn. I.M. I.A. subsequently until discharged to duty 29.12.34.

Readmitted 10.1.35. Stated he had been taking quinine grn. I. regularly twice a week. Suggested that he be weighed before re-admitting him with the intention of sending him to Durban to visit Soons.

Since now 20.1.35 blood counts normal.

Patient continues option and liver enlarged. Discharged 20.1.35. Instruction of Board that he give no injection of quinine 1/10 grn. I.M. I.A. twice a week. A blood count to be taken after every two injections. Readmit on failure.

Spleen and liver absent. Recommended no taking quinine as follows:-

1.11.44

injected is taken into the system.

3. Suspensions in the method of administering the drug and assurance that the whole amount is taken.

4. Assurance that the patient does take the drug.

These paragraphs give patients great assurance about taking.

5. Digestion treatment set up as often by as big mouth. Quinine by mouth should always be taken on full stomach not possible to vomiting.

6. Objectensible taste of quinine

Diseases against injections

1. Psoriasis. Trivial with good needle and small alternate needles should be injected.

2. Arthritis and bronchial swelling. With careful sterilization this can be reduced by a surgeon provided the needles at the selected places don't. Surgeon himself has not had a single case of disease in five years, sometimes giving a dozen injections a day. I consider that he definitely may be congratulated on the sterilizing care in administration.

3. Infiltrating areas. Totemic. Impossible with proper care.

The areas which have been found to respond best to injections are those by which there is a slight and chronic soreness (14-15) but where a rise of temperature daily. Two or three injections in alternate days usually have a prompt effect in cutting short an attack.

I. Review of existing situations

This is very difficult to give a definite opinion about. It is only after having worked years in the treatment of malaria that any comparison can be made between the different methods of giving quinine and then it is very difficult to give definite evidence as to the value of one particular method.

The people who arriving malaria do this country may be divided into three classes:-

I. Hospitals. This class is usually sent into hospital, if suffering from more than a mild attack and therefore not available for examination of their treatment.

II. Affluent families. In this class malaria is frequent but they seem to cure using the influence of quinine very probably not the ordinary mouth method is the best for them.

III. Indians. This class comes mostly under observation here, through their having to be treated by quinine injections against Pneumonia being kept. Admittedly Surgeon General has prohibited giving quinine injections using Quinine since 1930 and it is to him that I am indebted for most of the matter in this Report.

II. TreatmentQuinine.

It is also given this to patients not to determine but there is a large number of instances.

Side of Administration. Should always be the left hand because of absorption.

I. Number of doses of Quinine.

II. Duration that the Quinine remains absorbed.

20-14/200.

INQUIRIES

ADMISSION DEPARTMENT,

HEADQUARTERS OFFICER,

BALTIMORE, MARYLAND, JUNE, 1918.

SIR,

Ref: Correspondence with Lieutenant General R. H. Macmillan,
dated the 6th March, 1918.

I have the honor to communicate herewith, for your information, extracts from communications made by members of the Medical Department to this office, a portion of which will give the information required regarding the definite value of quinine as administered intravenously. The drug is not, in this Commonwealth, given subcutaneously. I have only selected definite facts from a mass of interesting material embodying detailed expressions of opinion in favor of the intravenous mode of administration of quinine.

1. The variety in the reported results of treatment performed in the various parts of this country is due to the fact that in some places these remedies are utilized whilst in other localities those subjected to the operation are passing themselves.

2. Such differences often taken from writer to have been

discrepancy

The Honorable,

The Chief Secretary,

[REDACTED]

British East Africa.

RECEIVED

JANUARY 26 1941 10 AM

With reference to the Bureau
despatch No. 41 of January 1941, on the subject
of the Annual Medical Report on this District,
I write for information that, I have been asked to be
present, herewith, copies of a letter from the
Principal Political Officer and extracts from com-
munications by the returning Physician Inspector
Tunapu, Senni, Great and Sandysdale, and Assistant
Surgeon Pyke.

2. I trust these will supply the informa-
tion desired by the Advisory Medical and San-
itary Committee for Tropical Africa.

I have the honor to be,

SIR,

Your humble, obedient servant,

John Joseph

Gouverneur.

THE GOVERNOR

ADMIRAL RICHARD LAM, K.C.B., F.R.S.,
