condition havinds has been described by Meese, while Feldman also in East Africa has found a similar disease known as Mijuo. If, however, the disease is an infection foreign to the Protectorate, then it must be one which may remain in abeyance, for the patient had returned to this country some nine months before he fell ill.

During the three months preceding the onset of his illness the man had worked in the hot and unhealthy country traversed by the upper waters of the Tana River. This is a sparsely inhabited country, and I have had no opportunity to find out whether symptoms such as the patient presented are known among the scanty population.

It is to be regretted that this particular case throws no light upon the etiology of this obscure disease.

I have to thank the Principal Medical Officer of this Protectorate for his courteous permission to put forward these observations on an unusual and interesting condition.
