## MINUTES

(Mr. Borthwaye, Secretary, 5 Nov 1921)

This is useful, and too large  
 for the minute book, but it  
 will be considered in time  
 of my consideration of the proposed conces-  
 sion to the Indian Paper Pulp Com-  
 pany, and I am sure  
 that we  
 will be able to make use of the  
 Indian Paper Pulp Company  
 services in India for the  
 purpose of making a better deal

Forests.

No. 276

From the Hon'ble Mr. MCMAHON, M.A., I.C.S.,  
Secretary to the Government of Bengal.

To The SECRETARY to the GOVERNMENT of INDIA,  
Department of Revenue and Agriculture.

Calcutta, the 8th January 1920

Sir,

I am directed to refer to Sir Edward MacLagan's circular No. 3F.-30-1, dated the 18th January 1913, in which it was laid down that forest contracts extending over a period of years, or over considerable areas, and connected with proposed new industries promising to be of commercial importance, should be submitted to the Government of India before being formally ratified by Local Governments. In accordance with that circular, I am to submit for the approval of the Government of India, a draft agreement which the Governor in Council proposes to enter into with the India Paper Pulp Company Limited (of which Messrs. Andrew Yule & Co., Ltd., of Calcutta, are the Managing Agents) for the extraction of bamboo from the Basudong Reserve in the Chittagong Hill Tracts Forest Division for the manufacture of paper pulp.

2. The forests, in respect of which the agreement is proposed to be made cover an area of about 427 square miles of evergreen and bamboo forest. The draft agreement has been drawn up in consultation with the Solicitor to the Government of India,

Forests.

No. 276

From the Hon'ble Mr. M.C. McALPIN, M.A., I.C.S.,  
Secretary to the Government of Bengal.

To The SECRETARY to the GOVERNMENT of INDIA,  
Department of Revenue and Agriculture.

Calcutta, the 8th January 1920

Sir,

I am directed to refer to Sir Edward MacLagan's circular No. 2F.-30-1, dated the 18th January 1913, in which it was laid down that forest contracts extending over a period of years, or over considerable areas, and connected with proposed new industries promising to be of commercial importance, should be submitted to the Government of India before being formally ratified by Local Governments. In accordance with that circular, I am to submit, for the approval of the Government of India, a draft agreement which the Governor in Council proposes to enter into with the India Paper Pulp Company Limited (of which Messrs. Andrew Yule & Co., Ltd., of Calcutta, are the Managing Agents) for the extraction of bamboo from the Kassalong Reserve in the Chittagong Hill Tracts Forest Division for the manufacture of paper pulp.

2. The forests, in respect of which the agreement is proposed to be made cover an area of about 427 square miles of evergreen and bamboo forest. The draft agreement has been drawn up in consultation with the Solicitor to the Government of India,

on the lines of the agreement entered into with Messrs. Davenport & Co., of Calcutta, for the extraction of timber from the Buxa Forest Division, and the manufacture of tea chests and three-ply wood, which was approved by the Government of India in Mr. Gilliat's letter No. 206-72-2, dated the 11th April 1918, subject to certain remarks contained therein. The period of the agreement now under consideration is 21 years, and the firm is given the option of a renewal for a further period upon such terms as may then be settled by mutual agreement. The firm is required to begin work not later than 1st January 1921 and to erect and supply on or before that date all necessary machinery and plant. No royalty will be charged for the first two years commencing from the 1st January 1920.

3. The Governor in Council has examined the proposal in the light of the Resolution No. 1456-216 A., dated the 10th April 1916, of the Government of India, Department of Commerce and Industry. Under the resolution concessions involving monopolies of production and supply should be granted only for a strictly limited period, and after giving public information of what is intended; but this general principle is not intended to prevent forest contracts, provided that they are not granted for unduly long periods and that, so far as possible, due publicity is given in inviting applications for such contracts.

4. The proposal for the grant of the lease was, therefore, duly published for public information. Four objections were received. The main ground of objection was that the reserve at present provides bamboos for the local needs of both Chittagong and the Chittagong Hill Tracts. The Governor in Council is, however, satisfied that the scheme is an important one both from the industrial and the forest point of view. It will ensure the economic exploitation

of the vast bamboo resources of the reserve, where wasteful methods of extraction at present prevail; and it will result in a substantial increase of revenue. At the same time His Excellency in Council is of opinion that it is essential in order that local interests may be adequately protected, to provide facilities for the extraction of bamboos for local needs. Provision has accordingly been made in clause 5 of the agreement that should the Conservator of Forests, Bengal, find that the bamboos required by the inhabitants of the neighbourhood cannot be fully satisfied by other sources of supply, he shall have power to arrange for the removal of a number sufficient for the purpose out of the Kasaleng Reserve. Provision has also been made to exempt dalo, (*Teinostachyum Dalleo*) which is almost exclusively used for floating purposes, from the license. As regards the question of export of bamboos to Chittagong, the Governor in Council is of opinion that there must be some interference with the trade by the dislocation of the supply from Kasaleng; but he is satisfied that the interference with trade will only last for a short time until the demand becomes adjusted to the other available sources of supply.

5. His Excellency in Council considers that the terms of the draft agreement are reasonable and that the scheme is a real advance in forest exploitation in Bengal. I am, therefore, to request that the Government of India may be moved to approve the draft agreement, and that orders may be communicated at an early date.

I have etc.,

M. C. McAlpin,

Secretary to the Government of Bengal.

An AGREEMENT dated the one thousand nine hundred and twenty made BETWEEN THE GOVERNMENT OF INDIA FOR INDIA IN COUNCIL (hereinafter called "the Secretary of State") of the one part and the India Paper Pulp Company, Limited, having its registered Office at 8 Clive Row, Calcutta, (hereinafter called the Lessees which expression where the context so admits or implies shall include its successors and assigns) of the other part.

1. The Secretary of State hereby grants to the lessees liberty to enter upon the Masalong Reserve, forest situated in the Chittagong Hill Tracts Forest Division, and to cut and remove therefrom bamboos of all kinds with the exception of *Teinostachyum Dulloca* commonly called *Dulloca*, such bamboos to be crushed and prepared at a factory or factories at Chittagong, the site of which shall hereafter be determined by mutual agreement between the Conservator of Forests, Bengal, and the lessees.

2. Government may cut and remove all bamboos that may be required by Government for civil or military purposes or for the requirements of the Public Works or Forest Department, and the lessees shall not in any way interfere with the servants of Government engaged in the work of cutting and removing such bamboos.

3. The lessees shall work through the area regularly and systematically in such manner and in such rotation which shall not be less than three years as shall be approved by the Conservator of Forests, Bengal, and shall remove all butts and tops as well as the central portions of the culms of the bamboos.

4. The lessees shall not hinder or prevent any person or persons holding permits duly issued by the Forest Department authorising them to cut *Teinostachyum Dulloca* Bamboos in the area subject to this agreement.

5. The Conservator of Forests, Bengal, if he deems fit, may cancel

the

the requirements for bamboo of the inhabitants  
of the area served by the Kasslong and the Karnaphuli rivers  
from Mainiarch to Maykyong Lukh cannot be fully satisfied  
by other sources of supply, shall have the power to arrange  
for the removal of a number sufficient for this purpose out  
of the Kasslong Reserve, and the lessees shall give the holder  
of permits given under this clause full facilities for the  
cutting and removal of bamboos.

In the event of Daloo bamboos flowering during the period  
of this license the Conservator of Forests, Bengal, shall have  
power to arrange for the removal of such number of bamboos

of any other species as may be in his opinion required for the  
purpose of floating timber provided that this quantity shall not  
exceed the average amount of Daloo bamboo extracted by local  
consumers during the previous five years.

6. The lessees shall not cut or remove any timber from the  
said Reserve except as provided in clause 12 hereof.

The lessees shall pay royalty at the following rates—

Nil for two years commencing from 1st January 1920,  
from 1st January 1922 to 31st December 1931 Re.1 per ton  
of crushed and baled bamboo leaving crushing mills,  
and Re.2 per ton for the remaining years of the license  
provided that in the event of the said royalty  
payable under this clause being less in any year  
from 1922 to 1931 inclusive than Rs.10,000/- the  
lessees shall pay such sum as will with the royalty  
paid on bamboo actually crushed and baled during  
such year, make up the sum of Rs.10,000/- and so  
during the years for 1932 to 1941 inclusive, except  
that minimum royalty shall be Rs.15,000. In the  
event of the flowering of any species of bamboo  
in the said reserve in any year the provisions of  
this proviso shall not apply.

8. The lessees shall commence work before 1st January 1922  
and shall on or before that date erect and supply all necessary  
machinery and plant to the satisfaction of the Conservator  
of Forests, Bengal, and in the event of their refusing so to  
do

do the Secretary of State may without prejudice to any other right or remedy hereunder forthwith by notice in writing to the lessee determine this agreement.

9. The lessees shall collect the bamboos cut from the reserve at such checking station outside the boundaries of the reserve as the said Conservator of Forests shall approve, where the bamboos will be enumerated and the number and species entered in a challan by a Forest Officer in the presence of an officer of the lessees, if they shall so require on production of this challa, free passing down of the rafts by the checking stations en route will be sanctioned. At the crushing mill the rafts will be checked with the challan by a Forest Officer in the presence of an officer of the lessees. The royalty on any bamboo lost in transit or not forthcoming at the final checking station shall be forthwith paid by the lessees on demand at the prevailing scheduled rate. In the event of the lessees bringing to the mill bamboos not extracted by them but purchased in the open market they shall be entitled to claim rebate of royalty at the prevailing schedule rates on such bamboos. The lessees shall not before payment of the royalty mentioned in paragraph 7 sell any bamboos otherwise dispose of them, except by using them in the crushing mill.

10. The lessees shall provide every person employed by them in cutting, collection and transport of bamboo with a suitable badge for the purpose of identification.

11. The lessees shall abide by and observe the forest rules in force for the time being in the said reserve, and should there be any neglect on the said rules by the lessees or by any of their employes the Divisional Forest Officer shall have power in case of urgent necessity at once to suspend during such time as he shall think fit, the work of the lessees or their employees in any such locality.

12. The lessees shall be entitled to procure from the said Reserve such building stone, timber and other forest produce as they may require for the purposes of this concession on payment of half the royalty in force for the time being as embodied in the published schedule of rates of the Chittagong Hill Tracts Division. All trees required by the lessees shall be first appraised and marked by Forest Officer, and the lessees shall not fell any tree which is not so marked.

13. The lessees shall be allowed the free use of water from any streams within the Reserved Forests with the previous consent in writing of the Conservator of Forests, Bengal, provided that the use thereof shall not, in the opinion of the Conservator, at any time be prejudicial to any pre-established rights of any village, or of any persons and provided that the water habitually used by such persons shall not be polluted and that due precautions be taken by the lessees to the satisfaction of the said Conservator to prevent any water in any way being polluted by their machinery or by the crushing of the bamboos and provided that the lessees shall make all such dams, tanks, water-channels and the like as shall in the opinion of the Divisional Forest Officer be necessary for the carrying out of their work in a secure and proper manner, and so as to minimise the risk of their causing landslip, floods, or soil erosion, and that if in the opinion of the Divisional Forest Officer all proper precautions are not at any time being taken to effect any or all of the said purposes, the Divisional Forest Officer may prohibit the use of such water by the lessees until such precautions have been taken.

Provided that nothing contained in this clause shall permit the lessees to do any act specified in sub-section (b) of section 76 of the Bengal Embankment Act, 1897 (Bengal Act II of 1892), without the previous permission of the Superintendent of the Chittagong Hill Tracts.

14. The lessees shall not erect any building nor clear sites for buildings or other purposes inside the Reserved Forest

without

without the previous consent in writing of the Conservator of Forests. For all such ground as shall be made available for clearing for building and other purposes, ground rent at the rate of Rs.5 per acre per year shall be paid in advance.

16. Subject as hereinafter mentioned this agreement shall continue in force for a period of 21 years from 1st January 1920 to 31st December 1941.

16. The lessees may terminate this agreement at any time before the expiry of the said period by giving notice to that effect in writing to the said Conservator on or before the first day of the year previous to the year in which they desire so to terminate this agreement.

17. In the event of the lessees failing to comply with any of the terms of this agreement as to which the opinion of the said Conservator shall be absolutely final and conclusive, or in the event of the lessees becoming insolvent or going into liquidation (except for purposes of reconstruction), it shall be lawful for the Secretary of State by notice in writing to the lessees under the hand of the Secretary to the Government of Bengal in the Revenue Department and notwithstanding any previous breach, to terminate this agreement at any time without prejudice to any other right or remedy of the Secretary of State hereunder.

18. In the event of this agreement being terminated under clause 16 or on the expiry of this agreement on the 31st December 1941, the lessees shall be entitled to remove within the next succeeding six months all machinery and other stores, tools and plant and pulp or other forest produce on which royalty has been paid in full.

The lessees shall also be entitled to remove within the same period such timber and forest produce obtained under clause 2 of this agreement at half the scheduled rates on payment of the balance required to make up with the sums already paid, the full scheduled rates then in force. On the expiry of the said

period of six months it shall be lawful for the Secretary of State to appropriate such machinery, stores, tools and plant buildings, timber and firewood, as may remain in the said area without payment of any compensation to the lessees and such machinery and other things shall become the property of the Secretary of State.

19. In the event of this agreement being terminated under clause 17 it shall be lawful for the Secretary of State to appropriate such machinery, stores and plant, buildings, pulp and other forest produce as may, in his opinion, be necessary to cover all loss and damage incurred by him and to dispose of the same as his own property.

20. In the event of the lessees wishing to continue working for a further period after the lapse of the twenty-one years specified in clause 15 above, they shall be given preference to do so under such terms as may then be determined by mutual agreement of both parties.

21. The rights of the lessees under this agreement may be assigned by the lessees to any company registered in India, the capital of which is offered for subscription in India, provided always that the company is not a foreign-controlled Company as defined in the Government of India's Notification No. 11917, dated the 6th October 1917, and provided also that such assignment shall be registered with the Conservator of Forests, Bengal.

22. In the event of any dispute arising with regard to the terms of these presents or the construction of meaning thereof or of any part thereof, or as to the performance of any act thereby required to be done, or as to any other matter or thing in connection therewith where not otherwise provided for, the decision of the Governor of Bengal in Council upon the matter of such dispute shall be final and binding upon the parties hereto.

copy of a letter No. 2183-I/21-1, dated Fort St. George, the 28th September 1921, from the Secretary to the Government of Madras, Development Department, to the Secretary to the Government of India, Department of Revenue and Agriculture.

733

In continuation of my telegram No. 2183-I, dated the 28th September 1921 regarding concessions to Messrs. Thomas Nelson and Sons, in connection with the establishment of a bamboo pulp factory in India, I am directed to forward a copy of G.O. No. 2431 Revenue dated the 20th August 1914 which shows the concessions asked for by the firm in the matter and those which Government were prepared to offer. But the offer was not utilised by the Company, apparently owing to the outbreak of the war. In 1916, Mr. G.M. Brown, a partner in the firm wrote to His Excellency Lord Pentland, then Governor of this Presidency, that the firm had to rule out the west coast as a possible field for their factory because of reported scarcity of water and of the report they had received that the bamboos in the locality had flowered and died over wide areas since 1914. He added that if there was any chance of the Government considering some grant to enable them to proceed with the establishment of a plant in India immediately, they would be very glad to consider the matter most carefully. The local officers were however of the opinion that there were ways of overcoming the difficulties pointed out; and the information collected by them was kept by Lord Pentland to one of the partners of the firm. The request for money grant was not considered and nothing further has been heard in the matter since.

GOVERNMENT OF INDIA  
DEPARTMENT OF REVENUE AND AGRICULTURE,

(Forests.)

SIMLA, 13th October 1921.

His Majesty's Under Secretary of State for India,

Paper-pulp concession to Messrs.  
Thomas Nelson and Sons.

ir.

With reference to the telegram from the Secretary of State No. 4805, dated the 19th September 1921, I directed to say that no wood pulp concession has been granted in India to Messrs. Thomas Nelson and Sons. It is understood, however, that the firm in question held shares in the India Paper Pulp Company which holds a concession in respect of bamboo pulp. Copies of the agreement and of the Government of Bengal's letter No. 276, dated the 6th January 1920 in respect of this concession are enclosed as is a copy of a letter No. 21831/21-1, dated the 28th September 1921, and enclosure, from the Government of Madras on the subject of what was at one time a proposal for Messrs. Nelson and Company to establish a bamboo factory in Malabar.

I have etc.,

M. Hearn,

Under Secretary.

*Rept. Inst.*  
I have the honour to acknowledge  
the receipt of Colonel Notley's despatch  
No. 190 of the 8th of August, with  
enclosures, on the subject of areas of  
bamboo for concessions for the manufacture  
of pulp and paper, and to transmit to you  
for your assistance in considering the  
matter, the enclosed copy of correspondence  
with the Imperial Institute, and also  
a copy of a letter with enclosures from  
the Govt. of India, regarding a paper  
pulp concession recently granted in  
India.

427. From the enclosures in Colonel  
Notley's despatch it would appear that  
there are only two areas workable at  
present, (a) the Kikuyu Escarpment. The  
whole area is estimated at 100 square  
miles, but the area lies at right angles  
to the railway and it only seems possible  
to offer one concession. I suggest  
that a block of from 40 to 100 square  
miles should be granted according to

the offer made by tenderers in respect of rent and capital, see paragraph 3 below. (b) The Southern Mau Escarpment. The total area here is about 40 square miles parallel to the railway. I suggest that it should be offered in two blocks of about 20 square miles each, but that the two ~~can~~ be combined in one block if sufficient capital were offered.

There would seem no reason why tenders should not immediately be invited by advertisement in Nairobi in respect of the ~~orders~~ <sup>areas</sup>.

above mentioned. The tender should state what rent the tenderers are prepared to offer, what capital they are prepared to expend and <sup>within</sup> in what period of time. Mr. Martin, with whom the matter has been fully discussed during his stay in this country, pressed strongly that no royalty should be charged, but that the Govt. should reserve to itself the right to impose export duty if later it was considered that the development of trade justified such a step. At the time when the discussion with Mr. Martin took place, I had not received the papers now enclosed as to the concession granted by the Govt. of India.

<sup>to the Paper Pulp factory</sup> It will be seen that the terms of that concession provide that the concessionaires shall pay no royalty for 2 years, but that they ~~should~~ pay thereafter for a space of 10 years 1 rupee per ton of cleaned and baled bamboo, and 2 rupees per ton for the remaining years of the licence, with a proviso that the total payment in any year shall not be less than a <sup>stated</sup> fixed sum. In view of this the matter seems to me to require further consideration, and I shall be glad of an expression

of your views by telegraph on the point. It is, of course, undesirable to throw any obstacles in the way of the establishment of the industry by imposing too onerous conditions, but on the other hand, it is important, especially in present financial circumstances, not to neglect any opportunity of obtaining revenue for the Colony.

4. I notice that in the terms of the Indian concession it is provided that in the event of the flowering of the bamboo, the provisions as to royalty shall not be applied. I am not aware whether this is a difficulty specially to be provided for in the case of Kenya, and I have not delayed this despatch by obtaining the views of my Technical advisers with regard to it. I shall be glad, however, to be furnished with any observations that Mr. Battiscombe may have to offer on the point.

5. Otherwise, I approve of the terms following those recommended by Mr. Battiscombe in his Memorandum "C" enclosed in Colonel Notley's despatch. The terms should, of course, be clearly stated in the advertisement calling for tenders.

6. As soon as the advertisement

has been published in Nairobi copies of the advertisement and of forms of tender should be immediately forwarded to me, when I may communicate copies to any persons who have made enquiries on the subject in this country.

7. As regard the time within which tenderers should be required to tender, it is, of course, desirable to avoid delay, but tenderers will require some time in which to prepare their tenders, and persons in this country will of course not receive the forms of tender until some time after the advertisement appears in Nairobi. I suggest that the case would be met if it were required that tenders should be received in Nairobi within six months of the date of advertisement, but I shall be glad to receive your observations as to this.

8. The information contained in the Report enclosed in the Imperial Institute letter of the 4th November, should be placed at the disposal of bona fide applicants, and I propose that the same course should be followed in the case of applicants in this country.

I have, etc.

(Signed) WINSTON S. CHURCHILL

has been published in Nairobi copies of the advertisement and of forms of tender should be immediately forwarded to me, <sup>as soon as</sup> I may communicate copies to any persons who have made enquiries on the subject in this country.

7. ### Bamboo Pulp Factory.

Funding orders on Messrs. Nelson & Co.'s scheme for the establishment of a — on the West Coast.

No. 2421, REVENUE, 20th August 1914.

GOVERNMENT OF MADRAS.

REVENUE DEPARTMENT

Read—the following papers:

I

G.O. MIS. No. 424, REVENUE, dated 10th February 1914.

Read—the following paper:

Reference from the Board of Revenue (Land Revenue), Forest No. 63-GI/14-1,  
dated 20th January 1914.

The Honble Mr. R. C. C. Carr, I.C.S.

Read—the following paper:

Letter from F. A. Lister, Esq., C.I.E., Conservator of Forests, Western Circles.  
To—the Secretary to the Commissioner of Land Revenue and Forests.  
Dated—the 1st January 1914.  
No.—H.D.C. 45 of 1914-3.

I have the honour to enclose copy of a letter received from Mr. T. Nelson (of Messrs. Nelson & Co., Edinburgh) on the subject of establishing a bamboo pulp factory on the West Coast.

Messrs. Nelson & Co. are willing to erect a factory on the Chaliar river, and ask Government to grant them certain concessions in the first few years of the enterprise.

The factory is to be capable of dealing with 20,000 tons of air dry bamboo annually, and its erection involves large capital expenditure. Messrs. T. Nelson & Co. are anxious to commence work as soon as possible and Mr. T. Nelson is desirous of taking home to his partners definite information regarding the concessions Government will grant. The following are the concessions asked for:—

(1) That Government shall sell to the company at a low price, or grant free for five years and thereafter, about 3,000 acres of land suitable for bamboo growth;

(2) that Government shall give the company an option on a further area for extension of bamboo plantations in the event of the enterprise proving a success;

(3) & (4) that Government shall deliver at a low price 10,000 tons of air dry bamboo in the first year and 20,000 tons annually thereafter until the company's plantations are in bearing;

(5) & (6) that Government shall grant a factory site with necessary water rights free of charge or if the company acquires a factory site Government shall grant the necessary water rights;

(7) that Government shall give official advice and assistance in regard to planting, etc;

(8) that the mill materials and machinery may be exempt from import duty;

(9) that the pulp exported may be exempt from export duty for a term of years;

(10) that "bamboo pulp paper" may be specified by Government contiguous

No. 2421, REVENUE, 20th August 1914.

I have told Mr. Nelson that it is impossible to definitely settle all these points in the short time available (Mr. Nelson leaves Bombay on the 7th February), but I think it is desirable that as far as possible definite replies should be given in order that the company may be in a position to order machinery and commence work as early as possible.

Taking the points *seriatim*—

(1) If the land required for plantations is in reserved forests a suitable area might be found in the new Amarampalam reserve; Mr. Nelson would prefer land nearer the proposed factory site near Kanniparamba, either in Calicut or Ernad taluk; the Collector of Malabar will be able to state whether the land is available. The land might be granted free of assessment for five years and thereafter subject to ordinary assessment.

(2) This must depend on what suitable land is available either in Amarampalam or nearer the proposed factory.

(3) & (4) I have informed Mr. Nelson that I cannot at present guarantee any fixed annual output of bamboo; I have called for reports from North and South Malabar and it will take some time to obtain reliable figures of stock; until these are available all that can be said is that Government will supply as many bamboos as possible from State forests at Ra. 3 per ton or cost price, whichever is greater, and will if possible supplement the supply by leasing and working private forests, such supplemental supply to be paid for on the same terms as the supply from State forests. I would limit the period of supply at cost price to five years, by which time the factory should be well established and Government should reap some benefit from the market created for their bamboo.

(5) & (6) I do not know whether the factory site is on private or Government land; if the latter, it might be granted free of charge for five years; there should be no difficulty about the grant of water rights.

(7) The advice of the local District Forest Officer can be made available.

(8), (9) & (10) These are outside my province.

2. I submit that every possible encouragement should be given to this enterprise which, if successful, will be followed by others and will not only bring in revenue, but also enable Government to reduce the annual stationery bill.

Both Burma and Oodain have offered liberal terms in order to facilitate the introduction of the bamboo pulp industry, and the concessions asked for by Mr. Nelson are not excessive.

3. Definite replies can be given at once to the last six points, and sympathetic consideration of the first four points can be promised; this would probably give Mr. Nelson sufficient grounds for putting work in hand on his return to England and I request that the orders of Government may be obtained at as early a date as possible.

ENCLURE.

Letter from Mr. T. NELSON (of Messrs. Nelson & Co., Edinburgh).  
To—the Conservator of Forests, Western Circles.  
Dated—the 7th January 1914.

I am very much obliged for all the information you have been good enough to give me in connection with the enquiry which I am here to make as to the possibilities of manufacturing paper pulp from bamboo.

I feel however that my mission here will not have been a complete failure if my partners' satisfaction turns on my return home; I am able to state definitely my own opinion (formed after careful investigation on the spot) as to the probable success or otherwise of the venture, but also what *measures* the Government of Madras are prepared to offer for the establishment of this new industry in the Presidency.

No. 2421, REVENUE, 20th August 1914.

Already definite offers have been made by the authorities of Burma and Cochin and it is in order that the Madras Government may consider what terms they are prepared to offer that I venture to write now, stating our exact position at the moment and our reasons for wishing that a decision should be come to on this matter if possible before I sail at the beginning of next month.

Since 1875, when Mr. Thomas Routledge experimented with the manufacture of paper from Trinidad bamboo, that fibre has been recognised as a very suitable one for paper-making. All attempts on any large scale to utilise it for that purpose have, however, proved failures up to the present time. A large mill started in the East has failed to give satisfactory results and one which was worked for some time in Trinidad has now been abandoned. In spite of these failures my firm are prepared to make a further experiment on a large scale either in India or the West Indies.

I feel sure that the Madras Government will realise the importance of establishing a large bamboo industry and will be willing like others to offer special inducements to firms ready to invest capital in such an enterprise. In asking the Madras Government to consider what special inducements they can grant us, I would like to draw your attention to the following considerations:

(1) Our plans involve the immediate expenditure of a very large sum to provide plant for an output of from 5,000 to 10,000 tons of pulp per annum and a rapid extension of the mill if the experiment proves a success.

(2) We intend to manufacture pulp of a high grade which (if our experiment succeeds) will establish the Madras product as superior to any other bamboo pulp made even experimentally up to this time.

(3) The previous experiments in bamboo pulp-making have been so disastrous that some special inducements are necessary before further capital will be attracted to the industry.

(4) Without entering too minutely into the methods by which we propose to make bamboo pulp, I may say that we are fully alive to the difficulties hitherto experienced in the manufacture, such as the removal of the incrusted matter from the bamboo, the treatment of the nodes, the bleaching of the pulp easily, etc., that we have erected and worked a complete experimental plant in Scotland large enough to test the matter commercially and that we have succeeded in producing a paper of a satisfactory character.

I give these particulars to let you know that, in spite of previous failures in making bamboo pulp, the methods we propose to use are, as far as we can see, likely to establish the industry on a new footing. This view is confirmed by one of the largest firms of paper-makers in Scotland, who have conducted all our experiments and have become partners with us in our enterprise.

In order to indicate the sort of facilities we would require before erecting a mill in the Madras Presidency I suggest—

(1) That (if no more suitable ground is available) the Government should sell to us at a low price, say, 8,000 acres of land suitable for the growing of bamboo. This land would be systematically planted and a crop might, we think, be expected in from four to six years. Alternatively, that the Government should give us that ground free for five years and thereafter for a long period at a nominal rent.

(2) That the Government should give us an option on any land available for growing bamboo to provide for the extension of the scheme should it prove a success.

(3) That to provide a sufficient quantity of bamboo for the mill, till such time as our own plantations come into bearing, the Government should deliver to us at the mill during the first year's working 10,000 tons of air dry bamboo (or the equivalent thereof) and during each succeeding year 20,000 tons of air dry bamboo.

(4) That the price for such deliveries should be, say, Rs. 3 per ton for all bamboo cut on Government land in the Nilambur district and that any bamboo over and above this that might be required to make up the necessary quantity should be charged to us at the net market price to the Government.

(5) That, if such is available, the Government should grant us free a suitable factory site with all necessary water rights.

(6) That, if no such site is available on Government land, the Government should grant us the necessary water rights at a factory site to be sourced by us from private owners.

(7) That the Government should give us advice and assistance through its officials in regard to planting, etc.

(8) That all the materials imported for constructing the mill and for manufacturing the pulp should be duty free for a period of years.

(9) That no import duty should be levied on bamboo pulp or paper for a term of years.

(10) That, when suitable, "Indian Bamboo Pulp" might be specified in Government contracts for paper.

If the above suggestions can be considered and some definite decision come to before I leave India, I shall feel greatly obliged.

No. 2431, REVENUE, 20th August 1914.

Reference—Forest No. 63-GL/14-1, dated 20th January 1914.

Submitted to Government.

2. The Board thinks that the proposals of Messrs. Nelson & Co., Edinburgh, deserve favourable consideration. No definite scheme can, however, be submitted till Mr. Nelson selects suitable localities for his proposed factory and bamboo plantation.

3. The Collector of Malabar will be requested to report on the points referred to in the Conservator's letter and its enclosure after seeing Mr. Nelson, if possible.

W. G. McFARLAND,  
Secretary.

To the Secretary to Government, Revenue Department.  
... Collector of Malabar.

Order—Mis. No. 424, Revenue, dated 10th February 1914.

Recorded.

2. The further report called for in paragraph 3 of the Board's Reference read above is awaited.

(True Extract.)

To the Board of Revenue, Land Revenue (Forests).

A. BUTTERWORTH,  
Ag. Secretary to Government.

## II

Reference from the Board of Revenue (Land Revenue), Forest No. 63/14-3,  
dated 9th June 1914.

The Honble Mr. R. C. C. CARE, I.C.S.

Read—the following papers:

(1)

Letter from C. A. INNES, Esq., I.C.S., Collector of Malabar.  
To—the Secretary to the Commissioner of Land Revenue and Forests.  
Dated—Calcutta, the 24th January 1914.  
No.—D. Dis. 163/P.

In reply to Board's Reference No. 63-GL/14-1, dated the 20th instant, regarding Mr. Nelson's proposals for the establishment of a bamboo pulp factory on the West Coast, I have the honour to say that I have seen Mr. Nelson and discussed the whole matter with him. In fact he stayed with me for three days.

2. I understand that Mr. Nelson leaves for Scotland on the 7th February and this being as it is out of the question for me to attempt to submit any useful report on the points indicated by the Board before Mr. Nelson leaves Madras. The first four concessions asked for by Mr. Nelson relate to the supply of bamboo and the grant of an area for a bamboo plantation. Mr. Nelson and Mr. Bourne went into this question very thoroughly at Nilambur and I understand that Mr. Bourne is writing a report on the subject for the Conservator. Mr. Nelson has arranged to meet Mr. Lodge at Madras on the 26th instant and they will then discuss together Mr. Bourne's report. Mr. Lodge will no doubt inform the Board of the results of this discussion and a decision will probably be arrived at at the conference as to the most suitable area for a plantation. When this area has been selected I shall be able to offer an opinion as to whether it can be sold or leased to Mr. Nelson.

3. Similarly as regards the factory site, as yet undecided at present where this site is likely to be. One possible site is 2½ miles up the Bypore river above the mouth, as owing to the expense of conveying coal on this distance it may be found necessary to put the factory at Bypore or Farakka, provided always that a

suitable water-supply can be secured. In either case it will probably be impossible for Government to give the site, there being little or no Government land available. In any case the determining factor must be the water-supply.

4. Mr. Nelson's letter to Mr. Lodge was written when he knew nothing of local conditions. He tells me that he would now be quite satisfied with a general assurance that Government will endeavour to help him on the lines indicated in that letter and I have no doubt that Government will willingly give that assurance. In the meantime until Mr. Nelson has seen Mr. Lodge and has discussed with him the bamboo question I see little use in attempting to write any further report and with the Board's permission I propose to wait until I hear either from the Board or the Conservator what decision has been arrived at as regards the site required for the bamboo plantation and as regards the other matters which are awaiting settlement in consultation between Mr. Nelson and Mr. Lodge.

(ii)

*Letter—from C. D. McCARTHY, Esq., Conservator of Forests, Western Ghats.  
To—the Secretary to the Commissioner of Land Revenue and Forests.  
Dated—the 4th May 1914.  
No.—R.O.C. 42.*

I have the honour to submit with my remarks the report on bamboo supply for paper pulp prepared by Mr. Bourne which were called for in Board's Reference No. 63/14-2, dated 18th February 1914. A copy of Mr. Bourne's report has already been supplied direct to Mr. Nelson by Mr. Lodge in January.

2. I was obliged to hold back Mr. Bourne's proposals for discussion of its numerous details and the data—often varying—on which he bases his results. And especially because this is the first scheme of systematic working of Indian bamboos on a commercial scale that I know of; and because next to nothing is known about the growth of bamboos, their rate of increase, and the effects of cutting on the future supply of the clump. Practically all the data had to be collected for the occasion by enumeration, dryage, weighment and deduction; whilst the variations in size and rate of increase for comparatively small changes of locality which is a peculiarity of the species, required close attention to detail. For example, it is found that 31 full-sized bamboos in the Nilambur district yield one ton of dry weight. Ten miles away at Amarapuram at the foot of the ghants where growth is more luxuriant 15 bamboos suffice for the same result. The number of culms per acre and the number of culms per clump vary almost as much; and this is the same species in both cases. It was impossible to accept variations of this sort upon which the whole estimate of supply depends, without examination and personal consultation with the writer.

3. As will be seen, the conclusion I have come to is that Mr. Bourne's calculations of the standing stock available are too conservative. Under the circumstances this caution is commendable but it has been carried to excess and I am of opinion that his figures may safely be doubled. On the other hand, his estimates of the annual yield are based on a removal at each cutting of 15 per cent. of the bamboos on the area and on the assumption that the culms so removed will be replaced by new annual shoots within a period of five years. In this Mr. Bourne follows Mr. Pearson's calculation, that this species of bamboo on the West coast and in Burma will on the average throw up one new culm per annum for every 4 old ones. That is to say, in four years it will a little more than double its numbers, and (allowing for a margin) that a five-year rotation will be a safe one. But this rate of growth refers to the naturally growing unexploited clump; and it does not follow by any means that it will be maintained if 75 per cent. of the clump is cut out at the start. It is in fact a matter of surmise, and rests on the issue between two opposing considerations. One of these is that the removal of congestion in the clump should tend to encourage growth of new culms, and the other that there must be some set back to growth from the sudden elimination of so much food and growing material for the stem, which in this case lies underground. In my opinion the balance would run in favour of the latter. As was said before we have very little knowledge of the subject but

at the same time we cannot ignore what few facts we have. One of these is the case recorded in clump No. 2, Appendix III, of the report. Here 75 per cent. of the clump of 20 bamboos was cut out four years ago and at present there are only 8 culms in the clump. If, as proposed in this report, the whole bamboo area were worked on a 75 per cent. rate of removal in the expectation that it would renew itself in five years, and the result were to approximate to this example, the effect would obviously be the suspension of all yield for some years till the area was fit for cutting again, and would be disastrous from the point of view of a regular supply for a factory.

4. As a matter of fact, from enumerations which I carried out in North Malabar last autumn in 8 or 10 different blocks, of the number of new annual culms to old, I am of opinion that the rate of increase varies with the age (i.e., the age) of the clump and taking the life period to be thirty years that the rate is probably greatest during the second and diminishes considerably in the last decade. These figures showed variations from one new culm per annum for 5 old ones in young clumps containing 10 to 15 bamboos; to 1 for 10 or more in clumps of 40 bamboos and over. I may say seeding seemed to be going on promiscuously and not gregariously in that district; or more that way than the other.

5. If this is true, no fixed rotation can be suitable for all periods of the life of the bamboo. In fact I do not think that regularity is attainable either as regards rotation or intensity of working: e.g., towards the seeding period almost every culm will be removed. However that may be, from the point at which we are starting the most rational system of working seems to be one of short rotations accompanied with light fellings, as this will entail the minimum of risk and also supply the fullest opportunities for observation. I mean to say, that if one were obliged to fix both the rotation and the intensity I should prefer to begin with one of 3 or 4 years with a 50 per cent. of extraction than one of five years with 75 per cent.

6. But we are here in a favourable position with no obligation at all to fix a rotation at starting. The exploitable area and the standing stock are so distinctly in excess of requirements, that we can start with light fellings—say 50 per cent.—which will easily meet the stipulated demand of Messrs. Nelson & Sons and go on doing so until the area of first fellings has recovered its original density of growth. When that has happened the intervening period will prove itself the proper rotation for that intensity of working.

7. For example in the present case we have two areas of different rates of productivity. We should commence in each at 50 per cent. removals. After three years' working it may be found that in one, the first fellings have recovered their original density of growth; whilst it takes four years to do so in the other. Or, the periods may be four and five years, respectively, or something else. Any how the right rotation for each must come out if it is three years or over, and it is not likely to be less. We are able to do this not only because we can easily cope with the demand but because one of the proposed conditions is that the first five years' supply is to be made at cost price, and consequently it is not to the interest of Government to turn out more, or to force the pace.

8. I have now to deal with the exploitable area, the estimate of stock and annual yield and the cost of extraction, transport and delivery to the proposed factory which will probably be at Beyapore. It may first be mentioned that as a supplementary source of supply in case of emergency, Mr. Bourne expects that 10,000 tons per annum of dry bamboo can be supplied from certain remote areas in the Manaraghata Range (chapter III of his report). Also that the District Forest Officer, North Malabar, can arrange for the delivery of 3,000 tons per annum from the Kanoth range. But this supply is not likely to be called upon in the near future, not only because of the greater cost of delivery, on account of the longer distances involved, but because the resources of the Nilambur and Amarapuram ranges in South Malabar are ample for the cohesion and easiest of supervision.

9. The supply stipulated for by Messrs. Nelson & Sons, is 10,000 tons dry bamboo in the first year after erection of their factory, which at earliest could not be before 1915-1916; and 20,000 tons per annum in each of the four succeeding years, or a total of 90,000 tons in the first five years. Confining consideration to the

Nilambur and Amarapalamp ranges, in the first place, allowance, as regards present supply, has to be made for the fact that flowering commenced in 1911 on some portions and has since been gradually extending. Dead (flowered) clumps are useless for pulp after two monsoons as the fibre becomes rotten or too soft. For this reason 8,890 acres of bamboo forest in the Nilambur range is thrown out of work for the present but will be available about eight years hence when the present seedling clumps attain workable dimensions.

10. Of the balance, the exploitable areas, viz., those which have been inspected by Messrs Bourne & Nelson put on the maps and computed (paragraph 2 of chapter I of report) amount to —

	acs.
Nilambur range	2,571
Amarapalamp range	26,096
Total	<u>28,669</u>

The "yield" from this area is given in paragraph 5 of chapter II of the report as 171,471 tons but there are arithmetical errors and the correct figure is 172,996 tons. By "yield" is here meant the exploitable stock which could at once be removed from this area after leaving 25 per cent. of the culms standing on the ground. Therefore the total stock on the ground would be 250,600 tons.

11. This estimate is based on most conservative data which I have carefully examined and an example of the extreme caution with which Mr. Bourne has dealt with the subject I append the following remarks —

(1) In Pokote and Kamakuth Mr. Pearson—a specialist in bamboos who came down from the Dehra Dun College—calculated the "yield" from sample areas at 9·9 tons per acre after leaving 25 per cent. standing. On the same conditions Mr. Bourne adopts 8·4 tons. This affects 1,506 acres.

(2) In weighing a sample culm for computation of yield in new Amarapalamp and Nelliyaith Mr. Bourne took a one year old culm, whereas the average culm of, say, four or five years would be much heavier. Even so, he has allowed for a dryage of 72/110 and at this rate the number of culms to 1 dry ton would work out at 15·8. Mr. Bourne has adopted 20. This affects the calculations for over 17,000 acres.

(3) For the same area he has adopted 11·85 culms to the clump following the average of an actual enumeration of a sample area. But this area was in a portion of forest lately fully cut over for bamboo required for floating timber; whereas he tells me that only about 2,000 acres has been so worked and he estimates that the number of culms per clump for the remaining 15,000 acres would be about 20.

Nos. (2) and (3) of the above reservations affect the estimate of stock enormously.

12. In paragraph 5 of chapter II of the report Mr. Bourne proposed also to reduce the exploitable area containing (bamboo paragraph 2 of chapter I) by one-half "as several blocks have not been inspected." But on that page, he gives the name of the areas which were inspected, "shown on maps and computed," and thus amounts to over 15,000 acres out of the total of 22,669 acres; and consequently I have not adopted the reduction he suggests. This is of course a very important correction of mine affecting half the stock, but I think it is fully justified.

13. There is, however, another factor not taken into consideration in Mr. Bourne's report which tends again to enormously increase the probable stock and output. The standing stock has been taken at about 230,000 tons. Of this only 90,000 tons will be removed in the five years 1915-1916 to 1920-1921. At that time the balance of 140,000 tons will be increasing at the rate of over 100 per cent. per four years. It is not worth while working out what all this will amount to, when it is obviously many times that of present requirements and I propose to leave the subject of stock and yield at this point, and pass on to the cost of extraction and delivery at factory.

14. In computing cost of delivery at factory there are two important considerations which affect expenditure and require explanation. At present bamboos are felled at about 15 feet from the ground. This is done to avoid the clearance of what is known as the "palisade" viz., the dense thorny ring of branches often 3 to 5 feet thick which surround the lower portion of the clump and prevent access to the culms. But of course this manner of felling entails considerable loss of material as the lower is the thickest and heaviest part of the culm. The removal of the palisade is a disagreeable, arduous and costly work and adds to the cost of the first working. If the second fellings occur within three to five years the palisade has not time to form again and the difference in cost of the two fellings on this account amounts to from Rs. 4 to Rs. 5 per 100 bamboos according as the daily wage is 6 annas or 8 annas per day. The other consideration is the fact that it costs just twice as much to draft down green as dry bamboo. Owing to the difference in weight only half the number can be tied together in one raft—otherwise they strand in the comparatively slow waterways available. Rafting is also the most expensive item in the cost of delivery and when the difference in cost between green and dry varies in some cases from Rs. 10 to Rs. 5 per ton it is obvious that only dry bamboos (six months dryage is sufficient) can be dealt with.—vide page 9 of Mr. Bourne's report. The cost of rafting varies also with the amount of water in the channels, so that different rates have been laid down for the dry and wet seasons of the year.

15. There are some arithmetical errors in the figures for the total cost of delivery at factory in Beyapore given in paragraph 8 of chapter I of the report. After correction the following table shows the cost for 1 ton dry output for delivery at Beyapore from \* viz., not the first and second years, but the different blocks of reserves, for the first and second cycles of working and for the dry and wet seasons

Total cost of felling, dragging and rafting one ton dry output to Beyapore.

Locality and range	First working		Second and subsequent working	
	December to May	June to November	December to May	June to November
Nilambur range, Amarapalamp range	Rs. 4. 2 p.	Rs. 4. 2 p.	Rs. 4. 2 p.	Rs. 4. 2 p.
Karim and Murial reserves	4. 2 p.	4. 2 p.	4. 2 p.	4. 2 p.
New Amarapalamp, Bellurtha and Karampaya reserves	4. 2 p.	4. 2 p.	4. 2 p.	4. 2 p.

The standing stock (paragraph 9 supra) on these areas amounts to the following —

On No. 1	TONS
On No. 2	20,565
On No. 3	8,412
On No. 4	200,683
Total	230,600

As it is possible that at some future time the whole area may come under full working, and also because it is all within easy reach of the head-quarters of the division and thus capable of being effectively superintended, I should propose that all the areas be worked in proportion to their capacity. That is to say that the proportion of 1,00,000 tons to be supplied in the first year should come from the three areas in the proportion of 1,00,000 and 8,500 tons respectively and double these amounts in each of the next four years.

16. As was the case with the estimation of the yield, the cost of working has been kept well or too much on the safe side. For instance the cost of felling, which is quoted at from Rs. 12-8-0 to Rs. 16-10-0 per 100 bamboos according as the wages are 6 annas or 8 annas per diem was computed on the actual cost of getting

two huge clumps containing 110 and 193 culms each (see Appendix V of the report). But the average clump contains only about 15 culms and the cost of cutting must be very much cheaper in small clumps. By how much it is impossible to say as at present, the felling is 15 feet from ground and we have no previous experience of cutting at ground level.

17. Again the cost of carting is quoted at 4 annas per cart per mile. Dragging with buffaloes would be easier and cheaper and could be done for less than 3 annas per mile for the same quantity. This would reduce the cost of extraction from areas No. 2 and 3 (paragraph 15) by about 4 annas per ton. But the drafting is the most expensive item and how far the estimates may be reduced I am unable to say.

18. Generally Mr. Bourne's rates in paragraph 15 over 2, may be compared with those submitted by Mr. Poultney for supply from Kanchan forests. His lengths of culm are shorter, and probably fully 500 tons represent one dry ton. At this rate his figures for delivery at Beypore work out to Rs. 4 per ton only. I think this is probably an under-estimate and it is calculated for floatage during monsoon only. It is very difficult to strike a balance, but I believe that Re. 1 per ton can safely be deducted from the corrected rates in paragraph 8 for supply from No. 2 area. 12 annas deducted from the No. 3 and 9 annas from ton from No. 1.

19. Adopting this margin for over-estimation and allowing for the rafting of three-fourths of the annual supply during the monsoon months, the following statement shows the total cost of supply of 10,000 tons at Beypore factory in the first year:

Locality	Supply in tons	Rate	Total charge
S. 1	M. 750 D. 250	Rs. 4 Rs. 6	Rs. 3,000 Rs. 1,500
2	M. 375 D. 125	Rs. 4 Rs. 6	Rs. 1,500 Rs. 900
3	M. 6,375 D. 2,125	Rs. 4 Rs. 6	Rs. 25,500 Rs. 15,000
Total	10,000		Rs. 37,600

M = Mahratta annas D = Dry season

20. The above estimate of charges depends on our being free to work the whole area. If however there is any force in the objection raised in paragraph 8 of Mr. Bourne's report on account of jenmi rights, then the only area workable is No. 3. It can supply the whole requisition for the first five years, if necessary. But this is a matter I am not able to decide.

21. There remain the questions of establishment, the housing of labour and staff, and drying sheds. For a scheme of this size with an output of practically 20,000 tons per annum, employing an average 20,000 tons = about 600,000 bamboo at 3 bamboo per cubic per diem = 160,000 peoples per annum. At 312 working days per annum about 500 peoples per diem.

Some of buildings and other contingencies, such that details may be omitted; but it is computed that 5 per cent. on the other annual charges for the five years of the contract will cover expenses.

22. At this rate the total estimate of charges for the supply of 10,000 tons in the first year will be—

Delivery of bamboo, 10,000 tons	Rs. 37,600
Permanent establishment	Rs. 600
Contingencies at 5 per cent. of above	Rs. 180
Total	Rs. 38,380

In the second to fifth years, the annual charges will be—

	Rs.	A.	K.
Delivery of bamboo, 20,000 tons	Rs. 75,268	0	4
Permanent establishment	Rs. 600	0	0
Contingencies at 5 per cent. of above	Rs. 945	2	5
Total	Rs. 76,800	2	9

This may have to be increased but if so the allowance for contingencies will meet it.

I believe, however, that the actual expenditure will fall within these amounts.

23. In conclusion some remarks are necessary on the general conditions of the proposed exploit. It is evident that for supply on this scale the forest area in working will have to be converted and treated for special bamboo production and its possibilities for other purposes will be deliberately sacrificed. Now if, in addition we are granting all the concessions asked for in Mr. Lodge's letter to the Board, R.O.C. No. 42 of 14-3, dated 8th January 1914 (including the supply to the firm for five years at *cost price*), the negotiations with the firm should safeguard Government from having this forest thrown back on its hands after that period in a condition which will be useless for any other purpose. This may happen through Messrs. Nelson & Sons making other arrangements by plantation lease or purchase from neighbouring private owners of which there is some talk in their letters.

24. There is not a doubt exemplified by the case of past reckless timber exploitation in the same area, that when the factory is established the neighbouring land-owners will come forward with offers below our own rates and it will be difficult to prevent the firm from taking advantage of them. Consequently we shall be in a difficult position with this private competition facing us, in coming years about the rates to follow the first five-year period of supply at *cost price*, if Messrs. Nelson & Sons are left with a free hand in the matter. Whatever terms are made it is advisable that they should provide as far as possible for the absorption of the full yield which our organisation is able to supply or if that is too much, for a preference over other sources of supply.

#### Reference—Forest No. 63, 14-3, dated 9th June 1914

Submitted to Government in continuation of Board's Reference No. 63/14-1, dated 20th January 1914, recorded in G.O. Min. No. 431, dated 10th February 1914.

2. Mr. Nelson of Messrs. Nelson & Co., Edinburgh, applied *inter alia* for the following concessions in connection with his proposed bamboo-pulp factory.

(i) that Government should sell to the company at a low price or grant free for five years and then rent, about 3,000 acres of land suitable for bamboo growth.

(ii) that Government should grant a factory site with necessary water-rights free of charge, or if the company acquired a factory site Government should grant the necessary water-rights, and

(iii) that Government should deliver at a low price 10,000 tons of air-dry bamboo in the first year and 20,000 tons annually thereafter until the company's plantations were in bearing.

3. Item (ii)—Mr. Bourne's report and Mr. McCarthy's letter deal only with item (ii).

The total area suitable for exploitation of bamboo in the next ten years in the Nilambur and Amarampalam ranges is estimated at 22,669 acres of reserved and leased forests. The stock on the ground is estimated at 230,680 tons. Allowing for 25 per cent. of the culms in each clump remaining on the ground, Mr. Bourne states that there is sufficient bamboo to meet the stipulated demand of Messrs. Nelson & Co. for five years. The stock, Mr. McCarthy thinks, has been under-estimated; he however, advocates the removal of only 50 per cent. of the culms. The Board understands that it is not advisable to remove more than 50 per cent. of the culms in each clump at a time as otherwise the clumps will be weakened that the next monsoon will cause much devastation. Even at this rate the stock on the ground is, in the Board's opinion, ample to meet the demand of Messrs. Nelson & Co., as they want only five years' supply or 90,000 tons in all.

Next as to the question of cost of supply Mr. McCarthy gives the following estimate of total charges to be incurred in the supply of the required quantity of bamboos at Beypore :—

Year	Quantity delivered per annum.	Value delivered per annum.
First year	10,000	7,408
Second to Sixth year	30,000	14,800

The Board generally accepts the figures which work out to about Rs. 7-6-0 per ton.

4. The Board is anxious that every encouragement should be given to the industry and that it should be done as speedily as possible, and accordingly suggests that Government should communicate the above figures to Messrs. Nelson & Co., by cable and ascertain what they have to say.

2-5 With reference to paragraph 28 of Mr. McCarthy's report suggesting that a condition should be inserted to the effect that Messrs. Nelson & Co., should continue to take bamboo from Government after the expiry of the first five years, the Board observes that the idea of the company is to have their own bamboo plantation. Five years' felling Government forests will, in the Board's opinion, do good by increasing the percentage of timber-yielding trees—at present there are too many bamboos—and this the Board considers should be one object of the fellings.

W. G. McFARLAND,  
*Secretary*

To the Secretary to Government, Revenue Department, with two plans.

**ENCLOSURE**

PRELIMINARY REPORT ON THE POSSIBILITY OF WORKING THE NATURAL FORESTS OF SOUTH MALABAR FOR BAMBOOS.

## CHAPTER I — GENERAL DESCRIPTION

*General description.*—As this report is a result of Mr. Pearson's note on the utilisation of bamboo for the manufacture of paper pulp, it is necessary to note at the commencement certain relevant facts.

Mr Pearson's stay in the district was unfortunately limited to three days, on one of which he saw the old teak plantations in Edaicode, of the second of which he laid out two bamboo sample acres one in Kankeeth, and the other in Pokote, and on the third of which he went to Nudugayam and back.

His visit was made in February 1910. In his report he has taken 8,080 acres in the Nilambur range as the area of fully stocked bamboo forest and based his calculation of the yield for this area on the statistics obtained from the sample areas in Kannur and Palakkad. In compiling this area from the areas given in the Nilambur teak plantation work plan maps he has overlooked the fact that some of these natural forest areas contain no bamboo at all while others are by no means fully stocked. In the last three years since Mr. Pearson's visit some of these areas have flowered.<sup>1</sup> Further in his report he has taken 1,880 acres of private forests calculated at a reduced yield. No bamboo can be available from the private forests in the Nilambur valley, as every workable area is cut over every year for bamboo to float the timber of private owners.<sup>2</sup> These forests have been so devastated of bamboo that the increasing numbers of applications for the grant of bamboo from Government forests are received every year, and it is a very significant fact that the rubber plantations on the edges of the valley, situated at a considerable distance from the centre of the timber operations have been able this year for the first time to sell their bamboo to timber contractors. Hitherto they have had to have recourse to fire to get rid of them.

Mr. Pearson in his report has taken Rs. 6 as the cost of cutting 100 bamboos, and double the present rate, to allow for the increased cost of cutting the culms at the base. This was unable to reflect any actual statistics of the cost of felling. Lastly the size of the trees were reduced in the forests and the ghatas are of considerably greater dimensions than those in Kandahar and U.Kote.

A few statistics on these points have been collected and a conservative estimate of the yield and cost of extraction from the Government forests made.

#### 2. Distribution and area.—

State of natural forest	Whether reserved or reserved forest	Area in acres.	Total
<i>Nilgiri Range</i>			
Vishakhapatnam and Ellore	Lopped forest	8,000	
Kankuth	Do.	100	
Chavakkad	Do.	600	
Pangangoda	Lopped forest and reserved	140	
Vaffanamari	Lopped forest	282	
Ernakulam	Do.	200	
	Do.	881	
<i>Ananthagiri Range</i>			
Snow & Marapakkam	Reserved forest	50,000	
Melamita	Do.	100	
Kallangoya	Reserved forest	1,750	
Karim	Do.	800	
Murai	Do.	1,250	
		52,000	102,250

Of these blocks, Valachapally and Edarode, Pakote, Kasakutty, Chathambadi, Panayangode, Valluvasheri, New Aumarappalam and Nellotta have actually been inspected by Mr. Nelson and myself with a view to noting the distribution of bamboo.

The exploitable approximate area at present under bamboo was put on the maps and computed.

A, proximate area explicable in the next ten years

Serial number	Name & rank	Presented or removed from service	Area under military agric.	District for use of resources	No. of arms in stock	Total
<i>National Army</i>						
1	Mahatma Gandhi Karmayogi	Left service	320	4	310	340

11	Murik	(d)	1,768	4	1,768	1,768
						24,090
						24,090

**Legal position** - In serial numbers I to 6, \* 10 and 11, being leased forests Government have by their agreements to pay **kutthikas** (recharge or sleep fees) on all bandoes extracted from these forests according to the custom of the country in vogue at present. The amount in vogue hitherto amounts to payment of 1/- per cent. of the net profits realized. It is shown in paragraph 2 of this chapter that the cost of extraction will be higher than estimated by Mr. Pearson and if Government agrees to pay the bandos and supply a paper pulp mill at cost price per ton, the forest jemans will complain. It is shown, however, in chapter I, paragraph 9 that the scientific felling proposed is likely to maintain or even increase the yield in the second rotation.

4. Composition and condition.—All these forested areas contain timber, though the density, age and dimensions of growth vary to a considerable extent in different localities.

The principal species occurring naturally throughout the area is *Hauhau* (*Crinum asiaticum*). This species flowers generally gregariously in one locality though it may flower periodically. The records of flowering in South Malaya are not very complete but it has been reported to have flowered gregariously in 1804, 1810, 1816, 1866, British Indian Forest, page 6, in 1861 Nalibar Plantation Working Plan page 10 and from present observations in this state in 1911, in Chateauroux in 1911 and 1912, in New Almarapumpam, Nedungad and Karunagappa in 1912, 1913 and 1914. In Kannikuthi Pekode and in a small area partly in Ettukadu and

partly in Vellochappally which will be called for the purposes of this report "Vellochappally and Edacoode" the bamboo may be considered to be fully stocked throughout the areas given. A few *Termitoxylon*, *Lagostachys* and *Datoeyga latifolia* are found forced up with long clean holes by the bamboo growth. In the New Amarampalam reserve the bamboo occurs less densely on the average, some areas being pure bamboo, which has killed out everything else, in others timber predominates, though almost throughout bamboo clumps are found.

In Nelliotttu the bamboo is on an average still less dense than in New Amarampalam, though the north-east quarter of the reserve is more fully stocked or at least denser than any other forests in the division. Karimpooye reserve, Karimut, Murat, Bramhadam, Valluvadai and Panayangode, though not now specially inspected for the distribution of bamboo, contain considerable quantities. While not being so fully stocked as Karakuth, etc., the bamboo in these areas is as dense and in some cases much denser than the average density of stocking in Nelliotttu reserve.

In Edacoode, the oldest of the flowered areas, an enumeration was made (see appendix II) to ascertain the minimum stocking of bamboo when it shall come into bearing. The size of the culms varies principally between the forests in the Amarampalam range (nearest the granite) and those in the Nilambur range.

The culms of New Amarampalam, Nelliotttu and Karimpooye are closed together, while the culms from all the other areas may be considered to be on the average, the same as the culms in Pukote and Karakuth, dimensions of which were taken by Mr. Pearson.

The method of felling bamboos in the past must be mentioned. It has been the custom to cut our bamboos some 12-15' above the ground for two reasons (1) to avoid the thorny paliads, and (2) to obtain cheapness in extraction, and (2) it was found by experiment that the bamboo cut at the base, though sufficiently buoyant to float by themselves, were insufficiently buoyant to float the teak saplings, which from the conditions of the market it was necessary to float green.

The result is to increase the palisade, in most cases the centre of the plump becoming so dense as to prevent any new culms being sent up except on the edges of the clump. This must affect the reproductive power of the clump from the root stock. It is noted in the Nilambur Teak Plantation Working Plan, page 43, that as a result of this flowering of many bamboos, in 1881 from 1888 onwards the number of the giant bamboo of Burma, *Cephalostachyum parviflorum*, were introduced along the banks of the rivers. No record is forthcoming as to how they were introduced but probably from seed. In 1896 Mr. P. M. Chisholm reported that they had formed splendid clumps, though the culms were of no great size. In 1904 the same officer reported that the clumps were decidedly disappointing and that the actual culms were still very small and appeared to be brittle. There is some doubt as to the identity of this species, the giant bamboo of Burma is *Dendrocalamus giganteus*. *Cephalostachyum parviflorum* as will be seen from appendix IV, grows no bigger in its natural habitat than it has here. Further this bamboo has a dense covering of stiff black hairs on the internodes which I find very irritating and so do the coolies. It probably is *Cephalostachyum parviflorum*, misnamed the giant bamboo of Burma and in that case it grows even better here than in Burma. The only doubt remaining is that *Cephalostachyum parviflorum* is said to have dense rigid, green whip-like branches from the lowest nodes, while the specimens here are practically clean. This bamboo has very succulent leaves and as the culms can be easily broken by elephants, all the clumps in those areas in which Government elephants are put out to graze have been completely bisected down. The possibility of introducing this bamboo on a plantation scale would be discussed in chapter IV.

5. *Form factors, reducing coefficients, etc., used in the calculation of the yield.*—These have been worked out in detail in appendices I and II. In chapter II the yield in the year of measurement is adopted, allowing to leave about 25 per cent. of the culms per clump standing—

(1) Yield from Karakuth, Pukote and Vellochappally and Edacoode—  
228 culms per acre.  
8.4 tons per acre dry.

(2) Yield from New Amarampalam reserve—  
Green culms alone—  
184 culms per acre.  
9 tons per acre dry.

Fully stocked—

226 culms per acre.  
14.75 tons per acre dry.

(3) Yield from Nelliotttu and Karimpooye reserves—  
Green culms alone—  
148 culms per acre.

Fully stocked—

7.8 tons per acre dry.  
186 culms per acre.  
9.25 tons per acre dry.

(4) Yield from Karimut, Murat, Bramhadam, Vellochappally and Panayangode—  
81 culms per acre.  
2.6 tons per acre.

*N.B.* These figures are calculated on the density of gross clumps in Nelliotttu, i.e., 12.5 clumps per acre and the average number of culms per clump to be left out the dimensions of the average culm from Mr. Pearson's Survey in Pukote and Karakuth.

(5) Future yield from Edacoode, Vellochappally and Chaitamborai—  
111 culms per acre.  
3.8 tons per acre.

(6) Of the bamboo from New Amarampalam, Nelliotttu and Karimpooye reserves—  
20 dry culms will yield 1 ton.

(7) Of the bamboo from Pukote, Karakuth, etc.—  
31 dry culms will yield 1 ton.

6. *Rates of growth.*—See appendix III.

7. *Supply of labour.*—Owing to the rubber estates on the edges of the valley, which, by the inducements they offer, As. 4 a day for an ordinary cooly, As. 6 for the better boys, As. 4 a woman or child, cooly lines free, and permanent work, have attracted most of local labour, in addition to imported labour brought in by cooly-catcher and owing to the general timber work labour is scarce. Government pay at present As. 4-6 a day per cooly in Nilambur range and As. 5 a day in Amarampalam range.

The scientific felling of *Bambusa arundinacea* clumps at the base needs skilful labour and is a trying and distasteful work to the coolies.

Consequently to offer an inducement to labour, it is proposed to pay for felling *Bambusa arundinacea*—

	Only per day
In Nilambur range	6
In Amarampalam range	8
For felling <i>Cephalostachyum parviflorum</i> —	
In Nilambur range	5
In Amarampalam range	6

These rates are allowed for in calculating the rates of extraction in appendix V.

Cooly-lines are proposed to be built in Amarampalam range, as without them, it will be impossible to count on a continuous supply of labour for the out-of-the-way and feverish forests of that range.

It is also probable that cooly-catching masters would have to be employed to import labour.

8. *Cost of extraction and transport to mill site.*—Tables—Figures have been worked out in detail in appendix V. It has there been shown that the floating charges of these big bamboos green is very high per 100 bamboo, though in the case of the biggest culms from Amarampalam range, of which 20 are equivalent to 1 ton, see paragraph 5 of this chapter, the cost per ton is proportionately reduced. It will be a simple matter to have six months' supply dried and dragged and stored under shelter in river side depots, always on hand, so that the figures of floating the bamboo dry have been adopted. Long low temporary sheds would be erected at river side depots for storing purposes.

#### Summary of cost.

Locality and range	Cost of felling 100 bamboos		Cost of cutting 100 bamboos from cutting place to

\* The figures in these columns have been corrected after allowing for arithmetical errors. Other errors have been corrected at only delivery at Bypore is required.—(Initiated—G.D.M.)

The improvement of the floating channels and the alignment and construction of main drag roads in those areas to be worked would reduce the cost of extraction considerably.

## CHAPTER II.—PROPOSED OUTLINES OF WORKING.

1. *Objects of management.*—It is understood that the minimum supply in tons of dry bamboo which would be required to start a paper-pulp mill on financial lines would be approximately 10,000 tons in the first year and 20,000 tons every year thereafter, with the prospect always of being able after the first five years to extend up to twice or even more than twice this amount. To boom this new industry which the more financially it is successful, the bigger the markets it will introduce to the extensive bamboo forests of this country, it is essential to produce the raw material at the lowest cost per ton possible.

It is therefore the object of Government to ascertain the highest sustained annual yield in tons of dry bamboo per acre available within an expenditure financially favourable to a private firm.

The indigenous bamboo having flowered during the last three years, the primary object to be ascertained is the possible yield in the next five years, it having been found on inspection that flowered culms after exposure to more than one season are useless for paper manufacture.

2. *Method of treatment and nature of the fellings.*—It is seen from Appendix III that failure to leave-standing the number of culms necessary to provide sufficient culm-area for the supply of assimilation products to the root stock, results in the total loss of the latter from the effects of the felling. In working on a large scale, the want of adequate supervision, it would be impossible to leave-standing any fixed proportion of the numbers of the culms in size and that they should be one year old culms, or in any case in which there were not three or four year old culms that a sufficient number of old culms should be retained to bring the total in every case to three or more. The culms should be felled within one foot of the ground. All bamboo for departmental timber floating operations should be felled on the same principles as soon as definite information is received that the mill will be started. The bottom ends will be cut off and stored under cover and will augment the supply in the first year of working. It is believed that if these bamboos are preserved from the wet they can be kept for several seasons and still be fit for paper-pulping.

It has been shown in Appendix III that after the first felling the thirty palisade is considerably reduced and no longer forms such a formidable obstacle in attacking a clump.

3. *Rotation.*—It has been shown in Appendix III that it would not be at present safe to fell over bamboo areas on less than a five-year rotation. It may be possible subsequently to reduce the rotation to four years.

A rotation of five years is adopted for the first cycle.

4. *Division of the working area into annual crops.*—It is not within the scope of this report to detail the annual crops. A much more detailed enumeration of the density of culms in each block is necessary before areas in any block can be apportioned to the annual crops with the object of maintaining continuity in distribution in the different ranges, in the fully worked and only partly worked areas, in the most and least accessible parts, etc.

5. *Determination of the yield.*—Determination of the total yield available in the Government forests 1914–15—

Range.	Name of block.	Bamboo area in acres.	Number of culms to be left per acre.	Number of culms to be cut per acre.	Yield of dry culms in tons per acre.	Total yield in tons.	Total yield in tons per acre.
Vallachappalli	Island	830	55	200	8.2	3,372	4.08
Muthukur	Island	506	55	200	8.2	2,542	5.04
Kanakukkudi	Island	480	55	200	8.2	2,464	5.08
Chettikulam	Island	204	55	51	2.6	522	2.56
Chettikulam	Island	581	55	51	2.6	1,532	2.64
New Ananthapuri	Island	14,007	All culms	100	12.0	168,084	12.00
Ananthapuri	Palisade	1,681	culms	100	7.5	12,608	7.50
Kanniyakumari	Island	1,700	culms	100	7.5	12,750	7.50
Kanniyakumari	Island	360	culms	100	7.5	2,700	7.50
Kanniyakumari	Island	1,765	culms	51	2.6	4,490	2.60
						167,471	
						Total	124,471

In this preliminary estimate no some of the areas are of such an enormous extent and as several blocks have not been inspected especially to ascertain the stocking of bamboos, it is safest to assume that one-half of such areas contain no bamboo at all. In the fully stocked areas of Kanakukkudi, Palikode and Vallachappalli and Islands, it is known that the whole area is stocked with bamboos, so that in these cases the full area may be retained.

The yield revised as above is—

Range.	Name of block.	Bamboo area in acres.	Number of culms to be left per acre.	Number of culms to be cut per acre.	Yield of dry culms in tons per acre.	Total yield in tons.	Total yield in tons per acre.
Vallachappalli	Island	830	55	200	8.2	3,372	4.08
Muthukur	Island	506	55	200	8.2	2,542	5.04
Kanakukkudi	Island	480	55	200	8.2	2,464	5.08
Chettikulam	Island	204	55	51	2.6	522	2.56
Chettikulam	Island	581	55	51	2.6	1,532	2.64
New Ananthapuri	Island	14,007	All culms	100	12.0	168,000	12.00
Ananthapuri	Palisade	1,681	culms	100	7.5	12,608	7.50
Kanniyakumari	Island	1,700	culms	100	7.5	12,750	7.50
Kanniyakumari	Island	360	culms	100	7.5	2,700	7.50
Kanniyakumari	Island	1,765	culms	51	2.6	4,490	2.60
		12,007.4	100 per cent.			150,200.8	
						Total	124,471

This yield of 124,471 tons, equivalent to more or less 2,000,000 bamboo has to be realized in five years; 10,014 tons in the first year and 20,000 tons in each of the four years thereafter. To obtain uniformity of distribution the areas were grouped together according to their yield in tons per acre. One-ninth of the area of each group is felled in the first year of working and two-ninths in each of the four years thereafter. It is expected that the first year

## No. 2421, REVENUE, 20TH AUGUST 1914.

of falling would be in 1915-16. No allowance is made for the new claims likely to be put on in the monsoon of 1915 and 1916, for it is assumed for the purpose of safety that the annual increment in each of these years would be cut out for departmental floating operations.

Name of blocks in group	Area of ground to work in acres	Number of areas of ground in 1914	Number of areas of ground in 1915	Yield in tons per acre	Total yield in 1914-15	Total yield in 1915-16	Number of areas of ground in 1915-16	Yield in tons per acre	Total yield in 1915-16	Number of areas of ground in 1915-16	Yield in tons per acre	Total yield in 1915-16
Velachappalli and Edapode.	1,500	197	1,500	200	200	3,000	20,000	200	200	200	200	4,000

Total	12,007.5	1,343	10,314	227.728	2,600	26,000	253,000	2,600	26,000	2,600	26,000	67,600

For the calculation of the yield in the second rotation it can be shown, on the assumption that in one year's growth, one culm is put on for every four standing culms at the commencement of the growth, that after five years growth from the date of felling a clump will contain exactly the same number of culms as in the year of felling, or that from the same area exactly the same yield is expected. Standard thousand tons however will be required and the balance will be obtained at the end of the second rotation from those areas which flowered in 1914 and have been enumerated; see appendix II.

Additional yield expected at the end of the second rotation.

Block	Bamboo area in acres	Number of culms to be felled per acre	Yield of dry culms in tons per acre	Total yield in tons
Number 1000 Chathuborai	2,700	135	10	28,900

For the calculation of the yield in the third rotation, all the areas which have flowered may be considered to be again fully stocked, see previous chapter, paragraph 4, and appendix II, enumeration of flowered clumps.

Yield in the third rotation.

Total		14,327.5			347,350	

An approximately 20,000 tons dry per annum.

## No. 2421, REVENUE, 20TH AUGUST 1914.

Owing to the subsequent steady advance of the region of flowering along the valley from west-east since 1911, and to the fact that the only location flowering in 1911 was on the extreme eastern boundary, it is hoped that no further flowering will occur after this year, so that the above figures of yield may not be affected.

## 6. Estimate for morning approximately 10,000 tons of dry bamboo in 1915-16—Bamboo operations—

## (1) Nilgiri Range.

Estimate for felling, dragging, carting, rafting and storing bamboo at Baypore or Chathuparam in 1915-16.

Item	Description	Quantity	Rate	Fees	Amount	Remarks
1	Felling bamboo	40,000	Rs. 1/- per	100	Rs. 229 2 1	
2	Dragging and carting bamboo to the nearest river	40,000	Rs. 1/- per	100	Rs. 229 2 1	
3	Cost of rafting bamboo to the nearest port	40,000	Rs. 1/- per	100	Rs. 229 2 1	
4	Cost of carting bamboo to Baypore	40,000	Rs. 1/- per	100	Rs. 229 2 1	
5	Carting charges	40,000	Rs. 1/- per	100	Rs. 229 2 1	
6	Transporting bamboo to port	40,000	Rs. 1/- per	100	Rs. 229 2 1	
7	Transferring of old culms from Baypore or Chathuparam to the nearest port by rail	40,000	Rs. 1/- per	100	Rs. 229 2 1	
8	Weighted and stowing in the Milagirai Range office	40,000	Rs. 1/- per	100	Rs. 229 2 1	
9	Add carting charges over an average distance of 10 miles and making up to 100 miles	40,000	Rs. 1/- per	100	Rs. 229 2 1	
10	Wages of labourers, porters, drivers, carters, packers, porters, etc., and other incidental works	40,000	Rs. 1/- per	100	Rs. 229 2 1	
11	Present value of old culms to be used a second time	40,000	Rs. 1/- per	100	Rs. 229 2 1	
12	Cartage	40,000	Rs. 1/- per	100	Rs. 229 2 1	
13	Total to Baypore	40,000	Rs. 1/- per	100	Rs. 229 2 1	
14	Total to Chathuparam	40,000	Rs. 1/- per	100	Rs. 229 2 1	

Estimated minimum number of culms required 20,000.

## (2) Ammapalayam Range.

Estimate for felling, dragging, carting, rafting and storing bamboos at Baypore or Chathuparam in 1915-16.

Item	Description	Quantity	Rate	Fees	Amount	Remarks
1	Felling bamboo Karion, Marid, New Ammapalayam, etc.	100,000	Rs. 1/- per	100	Rs. 229 11 2	
2	Dragging and carting bamboo to the nearest river Karion, Marid, New Ammapalayam, etc.	100,000	Rs. 1/- per	100	Rs. 229 11 2	
3	Cost of rafting bamboo in Chathuparam, Karion, Marid, New Ammapalayam, etc.	100,000	Rs. 1/- per	100	Rs. 229 11 2	
4	Cost of carting bamboo to Baypore, Karion, Marid, New Ammapalayam, etc.	100,000	Rs. 1/- per	100	Rs. 229 11 2	
5	Carting charges	100,000	Rs. 1/- per	100	Rs. 229 11 2	
6	Transporting bamboo to port	100,000	Rs. 1/- per	100	Rs. 229 11 2	
7	Transferring of old culms from Baypore or Chathuparam to the nearest port by rail	100,000	Rs. 1/- per	100	Rs. 229 11 2	
8	The culms to be weighted and further transported to Chathuparam or Milagirai Range office, and subsequently packed and sent to Madras by rail, the cost of packing and sending to Madras being included in the cost of carting and port charges	100,000	Rs. 1/- per	100	Rs. 229 11 2	
9	Present value of old culms to be used a second time	100,000	Rs. 1/- per	100	Rs. 229 11 2	
10	Cartage	100,000	Rs. 1/- per	100	Rs. 229 11 2	
11	Total to Baypore	100,000	Rs. 1/- per	100	Rs. 229 11 2	
12	Total to Chathuparam	100,000	Rs. 1/- per	100	Rs. 229 11 2	

Estimated minimum number of culms required 20,000.

CHAPTER III.—*PRINCIPLES FOR LEASING THE EXISTING PRIVATE BAMBOO FORESTS.*

It was stated in chapter I that no bamboo would be available from private forests in the valley and this must be accepted as a fact, for every bamboo is required for floating timber. Even when all the valuable timber has been removed the bamboo could be sold in the market, for as a commencement, Government would be removing some 50,000 bamboo from the market every year, being about the number necessary for floating the salt and which would be delivered to the paper-pulp mill. However the foot hills of the Keralas, the silent and Athapady Valleys in Mananthavady range are densely stocked with bamboo. It has been shown that Government can from their forests in the valley maintain the sustained annual yield necessary for the demand, but in the event of unforeseen circumstances, it may be advisable to have additional areas on lease under working. The map shows two denser stocked areas A and B, the difference in the two areas being, that while extraction from the former leads to the Palakkad Puzha, a tributary of the Kundalundi River, connected near its mouth by a navigable backwater with Beypore, extraction from the latter lies to the Kundalundi and the Periyar River and thence by sea to Beypore. The cost of extraction from the latter must necessarily be high.

Area A is partly registered in the name of the Kuthiravathil Nayar, partly as government pambokku.

Area B is partly registered in the name of the Kuthiravathil Nayar, and partly in the name of M. R. Jay, Palai Banas, Manch, though there are in both cases several additional claimants, so that it would be the safest policy to acquire the land. These foot hills are death traps in the monsoon so that they must be worked from August-May and the stored bamboo floated.

Assuming that the areas are as densely stocked with bamboo as Kandalam, etc., to maintain a sustained annual yield of 10,000 tons, an area of 5,000 acres would be required. The cost of extraction is estimated for area A as follows, the labour charges in Nilambur range being adopted; and allowance only made for floating dry bamboo on the roads—

Range & No. 1921 1922	Cost of felling 100 bamboo.		Dragging and carrying 100 bamboo over one mile at 1 shilling per yard and 1/- per mile.	No. of bamboos per tall.	Cost of carriage required at 1/- shilling per yard.		Cost of tying and putting up 500 bamboo per yard at 5/-.
	Rotation	Rotation	1	2	3		
Monsoonal per	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.
	13	10	10	10	10	10	10

Total cost of felling, dragging, carrying and  
putting up 100 bamboo.

A certain distance from railway place to Beypore in miles	Cost of bearing 1 tall of 100 bamboo to Beypore.		Total cost of felling and dragging 100 bamboo to Beypore.	100 bamboo.		1 bamboo per palli.	
	Rotation	Rotation		1	2	3	4
20	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.	Rs. A. Y.
	20	20	20	20	20	20	20

The calculated cost of extraction to Ponnam is 17 annas less per 100 bamboo, in both the I and II, rotation and 1/- annas less per ton dry bamboo.

The bamboo would then have to be shipped 85 miles to the coast to Beypore.

CHAPTER IV.—*WORKING OUTLINES FOR THE FORMATION OF BAMBOO PLANTATIONS WITH**Cynocalamus form. fragrans.*

It is shown in Appendix IV that numerous possibilities lie before a plantation of *Cynocalamus form. fragrans*. Grown from seed in 1898 it had formed sapling stage by 1905, until 1910 were obtained from stems and sown over a suitable site, reasonably moist as it prefers river banks, within 7 or 8 years it could be brought under working. It is understood that a very similar bamboo in Trinidad is raised by ploughing in lines 6' apart, about 10 apart and laying green cut stalks end-to-end and just covering them with moist earth; each produces a full, green stem or more in one year's growth and from this a yield of 40 tons per acre is produced. There seems no reason why this bamboo should not do the same.

The difficulty lies in the formation; at least 30 unseeded clumps can be found containing on an average (Appendix IV) 180 culms of average length 4'6" and average number of nodes per culm 25. Land and to cost 1/- per acre, 10/- per acre which is needed. From the 90 clumps, 1,350 culms would be available. This would plant up at least 70 acres. If 50 percent. of these nodes above produced one full-sized culm in one year's growth, 87,500 culms would be available which would plant up 500 acres. On the same assumption the yield from this area in the second year's growth would plant up 10,000 acres.

Working could therefore commence after three years' growth.

2. *Other works required.*—A plantation of this kind would, if situated in elephant country, need rigid protection in the form of a 6' x 6' trench all round the endangered circumference, with an elaborate system of pits. Such a trench latrine work at the rate of Rs. 14/-+0/- per 1,000 c. ft. would cost Rs. 2,705/- 16/- 8/- a mile or allowing for 2,000 c. ft. of solid rock blasting Rs. 2,044/- 3/- 2/- per mile. Some bamboo could be planted outside the trench amongst the pits as a base for the wild elephants.

3. *Cost of extraction.*—It is shown in Appendix V that the cost of extraction is extraordinarily low.

R. BOURKE,  
*District Forest Officer, South Malabar.*

NILAMBUR,  
25th January 1914.

## APPENDIX I

## (Fully stocked areas)

In Appendix VI of Mr. Pearson's note he gives the statistics obtained from sample plots laid out in Kannakkutti and Ekkottu and from which he calculated his figures of yield on pages 101 and 102 of his note. They are reproduced here for easy reference.

## SAMPLE plots in Nilambur Range taken in February 1910

Sample	Area of plot in acres	Number of culms	Number of culms per acre	Average size of culms per acre	Weight of dry culms in lbs.		Weight of dry culms per acre in lbs.	Yield of culms per acre in lbs.
					No.	Weight		
Kannakkutti	1	45	125	287	180	53	10/-	10/- 10/- 7,205
Ekkottu	1	45	125	286	180	53	10/-	10/- 10/- 7,200
Average per acre	1	45	125	287	180	53	10/-	10/- 10/- 7,205

These sample plots are taken by him as fully stocked bamboo areas. Unfortunately they were not demarcated and the exact position could not now be located.

A sample plot was laid out in an average area of Pekode as a check on Mr. Pearson's figures and only 40 stems were counted. It is thought advisable to reduce Mr. Pearson's figures to 40 stems per acre and the average per acre based on this figure works out as—

Average per acre	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
	45	125	287	286	180	10/-	10/-	10/-	10/-	10/-	10/-	10/-	10/-	10/-	10/-	10/-

It is necessary to point out that Mr. Pearson in calculating the yield per acre of dry culms in pounds in his figure 20,000 lbs. above him, if his estimation is of the yield in the year of measurement, based his figure on clear felling. He has however shown that the proportion of new culms to old is 1 is to 4 or 20 per cent. (page 93 of his note) so that his figure in the correct calculation of the yield, in the year subsequent to measurement if 20 per cent. of the culms are left standing. Further he has not taken into consideration the average number of stems per acre, but based the figure on the number of stems in Pekode alone. Under average, per acre 20,000 lbs. should be 10,000 lbs. In the calculation, based on the figure of 40 stems per acre, column 13 represents the yield of dry culms per acre, in pounds, clear felled, in the year of measurement; column 14 represents the yield of dry culms per acre, in pounds. In the year of measurement if 20 per cent. of the culms per acre are left standing. From the same figure 10,000 lbs. is the yield of dry culms, when 20 per cent. of the culms in a clump are left standing, or 20,000 lbs. per acre.

No. 2421, Ravenna, 20th August 1914.

## APPENDIX 16

(Partly stocked areas)

LINER SURVEY IN NEW ASAMOEPALI RESERVE STARTING FROM THE PUNNAPPOY, A SHORT DISTANCE SOUTH-WEST OF THE KORAMPOLY CAMP, IN A NORTH-WEST TO SOUTH-EAST STRAIGHT LINE. TWO CHAINS BRED.

Parcels and areas	Number of chains	Number of established green clumps	Number of cleared clumps of 1912	Number of cleared clumps of 1913	Number of green clumps along per acre	Total number of green clumps per acre

						12.5	15.9

The continuation of this line to the reserve boundary passes through very dense bamboo, so that this is a very conservative estimate.

In order to find the average number of culms per clump, an area which had been cut over for departmental bamboo in 1913 was enumerated. Every culm in each clump was counted, in order to find the number of marketable culms after the next monsoon. Every clump big and small was taken into consideration. New Amarampalam reserve, Korampaya beat.

33	7	7
34	9	9

This figure is a conservative estimate as every clump has been cut over in the year. This figure may also be taken for Nelliottia. As big scales were only available at Silambur it was decided to fell an average bamboo from new Amarampalam or Nelliottia, cover it to 100 cm. and then weigh it. For this purpose a one year old culm being of less weight than an

old culm of the same dimensions, was felled from a small clump on the hill near the Korampaya scrub. The measurements derived may therefore be considered conservative as the growth in the valleys is greater. The measurements were as follows:

Surveyable area in acres	Width in feet	Gross width in inches	Greatest width in inches	Number of clumps	Average breadth of wall at base	Distance from green to dry in ft.	Total weight dry in lb.
62	16	14	20	50	1.6	221.5	145.6

The dry weight measurement in the last column, as the culm could not be left for want of time to dry is calculated on the assumption that the green weight is to the dry weight of these bamboo as the green weight is to the dry weight of the bamboo measured by Mr. Pearson from Poole. To be absolutely safe a 50 per cent dryage loss of weight will be allowed or 110 lb. taken as the dry weight of one culm.

#### Calculations of the yield per acre for Nelliottia and New Amarampalam reserves separately

Locality	Average number of clumps per acre	Average number of clumps per acre actually measured	Average number of culms per clump	Weight of one culm dry in lb.	Yield from green culms per acre in lb.	Yield from green culms per acre in lb.	Yield when fully dried of dry culms per acre in lb.

The growth when mature may be calculated on Mr. Pearson's figures from Pohore.

Locality.	Avg. age of clump	Number of clumps	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	Total weight per acre	Total weight per acre per clump	Total weight per acre per clump per clump
Edacode	16	81	107	Average of 100 clumps.	209	16.2	109.2	71.1	3,084	8.8															

### APPENDIX III.

#### (Rate of growth).

In May 1912, the Guards' Vernacular Training School felled one or two clumps in Kanakuth to scientific principles at the base. These were the only statistics available of the reproduction from the root stock; two additional clumps were augmented. The Best Guard who attended this school stated that in every clump all the one year old culms were left standing. The number of culms cut could be easily estimated by the number of stumps remaining.

Number of clump.	Initial number of culms existing in 1911	Number of culms left standing in 1912	Number of culms cut in 1912	Number of culms existing in 1913	Number of culms left standing in 1913	Number of culms cut in 1914	Number of culms existing in 1915	Number of culms left standing in 1915	Number of culms cut in 1916	Number of culms existing in 1917	Number of culms left standing in 1917	Number of culms cut in 1918	Number of culms existing in 1919	Number of culms left standing in 1919	Number of culms cut in 1920	Number of culms existing in 1921	Number of culms left standing in 1921	Number of culms cut in 1922	Number of culms existing in 1922	Number of culms left standing in 1922	Number of culms cut in 1923	Number of culms existing in 1923	Number of culms left standing in 1923

Cost of floating baulks in the ghatis—It was understood from Mr. Nelson that, provided a sufficient quantity of good water was obtainable at Raypur, everything pointed to Raypur as the most practicable mill-site in comparison with Chailaparam. The cost of floating is therefore worked out both to Chailaparam and to Raypur.

The floating charges are first calculated to Pongalur, where the single raft is disengaged and broken up into components.

Secondly from Pongalur to Chailaparam and thirly from Chailaparam to Raypur. In the dry season, raft can easily be taken from Chailaparam to Raypur. During the six months December-May inclusive, the water in the river is so low that only a reduced number of baulks are loaded into a raft, and that the actual floating charge of one raft is raised by 50 per cent. The baulks felled from the two sample stumps in Vallayasheri were used for this purpose for the collection of data.

Throughout except where otherwise stated, green baulks were being considered.

It is estimated that all bamboo cut are stored under shelter after felling for six months and then floated dry, it will be possible to float twice as many bamboo in a raft than if they were green. The cost of rafting per 100 and per ton dry bamboo would then be halved.

*Cephalostachyum Pergracile*.—In the case of the two clumps felled, data of felling, rafting, etc., were collected.

Three hundred and seventy-four culms were hauled and five half-bamboos or a total of 879 units by 19 coolies in one day, or 20 culms per cooly per day.

Once the test was completed, the total time spent on each item was calculated.

**Order No. 2421, Revenue, dated 20th August 1914.**

With its Forest Reference No. 63-614-1, dated 20th January 1914, the Board of Revenue submitted a scheme formulated by Mr. T. Nelson of Messrs. Nelson & Co., Edinburgh, Forest No. 1211,

for the establishment on the West Coast of a factory for the manufacture of paper pulp from bamboo. In furtherance of his scheme Mr. Nelson has asked for certain concessions, the more important of which are dealt with below:

2. Mr. Nelson requests that the Government should either themselves sell bamboo to his company at a low price, or grant, free of rent for five years and thereafter subject to rental, an extent of about 30,000 acres of land suitable for bamboo growth with an option on a further area for extension of bamboo plantations in the event of the enterprise proving a success. The Government cannot undertake to stipulate that a private firm may consider any considerable extent of land below its proper value, but they are prepared to consider an application for temporary remission of assessment on the analogy of the concessions specified in the notes to clause 15 of Board's Standing Order No. 20.

3. As to the quantity of the supply of bamboo desired, Mr. Nelson asks that the Government should deliver to the company 10,000 tons air dry in the first year and 20,000 tons annually thereafter until the company's plantations are in bearing. The Board has submitted with its ~~1914~~ remarks and those of the Conservator of Forests, Western Circle, a careful detailed report prepared by Mr. Bourne on the possibility of working for bamboo certain ~~natural~~ forests in South Malabar. The Government are inclined to agree with the Board in the view that the thinning of bamboo should benefit, rather than injure, the forests and for that reason they consider it unnecessary to stipulate that the company shall continue to buy bamboo from the Forest Department after the expiry of the proposed initial period of five years. As regards the rate at which bamboo should be sold to the company, the Government are prepared to supply at cost price for two years, but after that period they must stipulate for a profit of 12½ per cent. The cost price cannot be guaranteed but on the data available Mr. Nelson may be informed that it seems likely to work out to about Rs 7-8-0 per ton.

4. With reference to his request for the grant of water rights to the company's factory free of charge, the Government consider that while water power may be given, if locally available, there should be a fair payment for the supply taken.

5. Mr. Nelson next asks that all the materials imported for constructing the company's mill and manufacturing the pulp should be exempted from import duty and that for a term of years no export duty should be levied on bamboo pulp or paper. He should be informed that there is no import duty on paper pulp and that no concession in respect of import duty can be granted.

6. Mr. Nelson's last request is that bamboo pulp paper should be specified in Government contracts for paper. The Government can give no such promise until the price and the quality of the paper manufactured by the company are known. But Mr. Nelson may be assured of all reasonable official advice and assistance in the proposed enterprise.

7. The Board of Revenue will be requested to communicate to Mr. Nelson the substance of the foregoing remarks and to issue instructions to the Forest officers concerned to conduct careful experiments and observation as to the reproductive power of bamboo, the cost of its production, etc.

*True Extract.)*

L. DAVIDSON,  
As Secretary to Government.

The Hon'ble Mr. R. C. C. CARE, I.O.S.

Read—the following paper :—

*Letter—from F. A. LORER, Esq., C.I.E., Conservator of Forests, Western Circles.  
To—the Secretary to the Commissioner of Land Revenue and Forests.  
Dated—the 16th January 1914.  
No.—R.O.C. 42 of 1914-3.*

I have the honour to enclose copy of a letter received from Mr. T. Nelson (of Messrs. Nelson & Co., Edinburgh) on the subject of establishing a bamboo pulp factory on the West Coast.

Messrs. Nelson & Co. are willing to erect a factory on the Chaliar river, and ask Government to grant them certain concessions in the first few years of the enterprise.

The factory is to be capable of dealing with 20,000 tons of air dry bamboo annually, and its erection involves large capital expenditure; Messrs. T. Nelson & Co. are anxious to commence work as soon as possible and Mr. T. Nelson is desirous of taking home to his partners definite information regarding the concessions Government will grant. The following are the concessions asked for :—

(1) That Government shall sell to the company at a low price, or grant free for five years and then rent, about 8,000 acres of land suitable for bamboo growth;

(2) that Government shall give the company an option on a further area for extension of bamboo plantations in the event of the enterprise proving a success;

(3) & (4) that Government shall deliver at a low price 10,000 tons of air dry bamboo in the first year and 20,000 tons annually thereafter until the company's plantations are in bearing;

(5) & (6) that Government shall grant a factory site with necessary water rights free of charge or if the company acquires a factory site Government shall grant the necessary water rights;

(7) that Government shall give official advice and assistance in regard to planting, etc.;

(8) that the mill materials and machinery may be exempt from import duty for a term of years; and

(10) that "bamboo pulp paper" may be specified in Government contracts for paper when suitable.

I have told Mr. Nelson that it is impossible to definitely settle all these points in the short time available (Mr. Nelson leaves Bombay on the 7th February), but I think it is desirable that as far as possible definite replies should be given in order that the company may be in a position to order machinery and commence work as early as possible.

Taking the points *separately*—

(1) If the land required for plantations is in reserved forests a suitable area might be found in the new Amarampalam reserve; Mr. Nelson would prefer land nearer the proposed factory site near Kanniparumba, either in Calicut or Ernad taluk; the Collector of Malabar will be able to state whether the land is available. The land might be granted free of assessment for five years and thereafter subject to ordinary assessment.

(2) This must depend on what suitable land is available either in Amarampalam reserve or nearer the proposed factory.

(3) & (4) I have informed Mr. Nelson that I cannot at present guarantee any fixed annual outturn of bamboos; I have called for reports from North and South Malabar and it will take some time to obtain reliable figures of stock; until these are available all that can be said is that Government will supply as many bamboos as possible from State forests at Rs. 3 per ton or cost price, whichever is greater, and will if possible supplement the supply by leasing and working private forests, such supplemental supply to be paid for on the same terms as the supply from State forests. I would limit the period of supply at cost price to five years, by which time the factory should be well established and Government should reap some benefit from the market created for their bamboos.

(5) & (6) I do not know whether the factory site is on private or Government land; if the latter, if might be granted free of charge for five years; there should be no difficulty about the grant of water rights.

(7) The advice of the local District Forest Officer can be made available.

(8), (9) & (10) These are outside my province.

2. I submit that every possible encouragement should be given to this enterprise which, if successful, will be followed by others and will not only bring in revenue, but also enable Government to reduce the annual stationery bill.

Beth Burma and Cochin have offered liberal terms in order to facilitate the introduction of the bamboo pulp industry, and the concessions asked for by Mr. Nelson are not excessive.

3. Definite replies can be given at once to the last six points, and sympathetic consideration of the first four points can be promised; this would probably give Mr. Nelson sufficient grounds for putting work in hand on his return to England and I request that the orders of Government may be obtained at as early a date as possible.

## ENCLOSURE

*Letter—from Mr. T. Nelson (of Messrs. Nelson & Co., Edinburgh)  
To—the Conservator of Forests, Western Circles  
Dated—the 16th January 1914.*

I am very much obliged for all the information you have been good enough to give me in connection with the inquiry which I am here to make as to the possibilities of manufacturing paper pulp from bamboo.

I feel however that my mission here will not have been accomplished either to my own or my partners' satisfaction unless on my return home I am able to state definitely not only my own opinion (formed after careful investigation on the spot) as to the probable success or otherwise of the venture, but also what indications the Government of Madras are prepared to offer for the establishment of this new industry in the Presidency.

## No. 2421, Revenue, Madras, 1914.

Already definite offers have been made by the authorities of Burmah and Ceylon and it is in order that the Madras Government may consider what terms they are prepared to offer that I venture to write now, stating our exact position at the moment and our reasons for wishing that a decision should be come to on this matter if possible before I leave at the beginning of next month.

Since 1875, when Mr Thomas Routledge experimented with the manufacture of paper from Trinidad bamboo, this fibre has been recognised as a very suitable one for paper-making. All attempts on any large scale to utilize it for that purpose have, however, proved failures up to the present time. A large mill started in the East has failed to give satisfactory results and one which was worked for some years in Trinidad has now been abandoned. In spite of these failures my firm are prepared to make a further experiment on a large scale either in India or the West Indies.

I feel sure that the Madras Government will realize the importance of establishing a large bamboo industry and will be willing like others to offer special inducements to firms ready to invest capital in such an enterprise. In asking the Madras Government to consider what special inducements they can grant us, I would like to draw your attention to the following considerations:-

(1) Our plans involve the immediate expenditure of a very large sum to provide plant for an output of from 5,000 to 10,000 tons of pulp per annum and a rapid extension of the mill if the experiment proves a success.

(2) We intend to manufacture pulp of a high grade which (if our experiment succeeds) will establish the Madras product as superior to any other bamboo pulp made even experimentally up to this time.

(3) The previous experiments in bamboo pulp-making have been so disastrous that some inducements are necessary before further capital will be attracted to the industry.

(4) Without entering too minutely into the methods by which we propose to make bamboo pulp, I may say that we are fully alive to the difficulties hitherto experienced in the manufacture, such as the removal of the incurring matter from the bamboo, the treatment of the nodes, the bleaching of the pulp, easily, etc., that we have erected and worked a complete experimental plant in Scotland large enough to test the matter commercially and that we have succeeded in producing a paper of a satisfactory character.

I give these particulars to let you know that, in spite of previous failures in making bamboo pulp, the methods we propose to use are, as far as we can see, likely to establish the industry on a new footing. This view is confirmed by one of the largest firms of paper-makers in Scotland, who have conducted all our experiments and have become partners with us in our enterprise.

In order to indicate the sort of facilities we would require before erecting a mill in the Madras Presidency I suggest:-

(1) That if no more suitable ground is available, the Government should sell to us at a low price, say, 8,000 acres of land suitable for the growing of bamboo. This land would be systematically planted and a crop might, we think, be expected in from four to six years. Alternatively, that the Government should give us that ground free for five years and thereafter for a long period at a nominal rent.

(2) That the Government should give us an option on any land available for growing bamboo to provide for the extension of the scheme should it prove a success.

(3) That to provide a sufficient quantity of bamboo for the mill, till such time as our own plantations come into bearing, the Government should deliver to us of the time during the first year's working 10,000 tons of air dry bamboo (or the equivalent thereof) and during each succeeding year 20,000 tons of air dry bamboo.

(4) That the price for such deliveries should be, say, Rs. 8 per ton for all bamboo Government land in the Nilambur district and that any bamboo over and above this that might be required to make up the necessary quantity should be charged to us at its net cost price to the Government.

(5) That, if such is available, the Government should grant us free a suitable factory site with all necessary water rights.

(6) That, if no such site is available on Government land, the Government should grant us the necessary water rights at a factory site to be secured by us from private owners.

(7) That the Government should give us advice and assistance through its officials in regard to planting, etc.

(8) That all the materials imported for constructing the mill and for manufacturing the pulp should be duty free for a period of years.

(9) That no export duty should be levied on bamboo pulp or paper for a term of years.

(10) That, when suitable, "Indian Bamboo Pulp" might be specified in Government contracts for paper.

If the above suggestions can be considered and some definite decision come to before I leave India, I shall feel greatly obliged.

## No. 2421, Revenue, Madras, 1914.

*Reference—Forest No. 63 GL/14-1, dated 20th January 1914.*

*Submitted to Government.*

2. The Board thinks that the proposals of Messrs. Nelson & Co., Edinburgh, deserve favourable consideration. No definite scheme can, however, be submitted till Mr. Nelson selects suitable localities for his proposed factory and bamboo plantation.

3. The Collector of Malabar will be requested to report on the points referred to in the Conservator's letter and its enclosure after seeing Mr. Nelson, if possible.

W. G. McFARLAND,  
*Secretary*

To the Secretary to Government, Revenue Department.  
Collector of Malabar.

*Order—Mis. No. 424, Revenue, dated 10th February 1914.*

*Recorded.*

2. The further report called for in paragraph 3 of the Board's Reference read above is awaited.

(True Extract.)

A. BURRIN-SOUTH,  
*Ag. Secretary to Government.*

To the Board of Revenue, Land Revenue (Bills).

II

*Reference from the Board of Revenue (Land Revenue), Forest No. 63/14-3,  
dated 9th June 1914.*

The Hon'ble Mr. R. C. C. CARE, I.C.S.

*Read—the following papers—*

*Letter—from C. J. INGRAM, Esq., Collector of Malabar.  
To—the Secretary to the Commissioner of Land Revenue and Forests.  
Dated—Calcutta, the 24th January 1914.  
No.—D.D. 163 P.*

In reply to Board's Reference No. 63 GL/14-1, dated the 20th instant, regarding Mr. Nelson's proposals for the establishment of a bamboo pulp factory on the West Coast, I have the honour to say that I have seen Mr. Nelson and discussed the whole matter with him. In fact he stayed with me for three days.

I understand that Mr. Nelson leaves for Scotland on the 7th February and this being so it is out of the question for me to attempt to submit any useful report on the points indicated by the Board before Mr. Nelson leaves Madras. The first four concessions asked for by Mr. Nelson relate to the supply of bamboo and the grant of an area for a bamboo plantation. Mr. Nelson and Mr. Bourne went into this question very thoroughly at Nilambur and I understand that Mr. Bourne is writing a report on the subject for the Conservator. Mr. Nelson has arranged to meet Mr. Lodge at Madras on the 20th instant and they will then discuss together Mr. Bourne's report. Mr. Lodge will no doubt inform the Board of the results of this discussion and a decision will probably be arrived at at his conference as to the most suitable area for a plantation. When this area has been selected I shall be able to offer an opinion as to whether it can be sold or leased to Mr. Nelson.

3. Similarly as regards the factory site. It is quite undecided at present where this site is likely to be. One possible site is 24 miles up the Beypore river above the falls; owing to the expense of conveying coal up this distance it may be found necessary to put the factory at Beypore or Murha, provided always that a

6

No. 2122, Revenue, 20th August 1914.

suitable water-supply can be secured. In either case it will probably be impossible for Government to give the site, there being little or no Government land available. In any case the determining factor must be the water-supply.

4. Mr. Nelson's letter to Mr. Lodge was written when he knew nothing of local conditions. He tells me that he would now be quite satisfied with a general assurance that Government will endeavour to help him on the lines indicated in this letter and I have no doubt that Government will willingly give that assurance. In the meantime until Mr. Nelson has seen Mr. Lodge and has discussed with him the bamboo question I see little use in attempting to write any further report and with the Board's permission I propose to wait until I hear either from the Board or the Conservator what decision has been arrived at as regards the site required for the bamboo plantation and as regards the other matters which are awaiting settlement in consultation between Mr. Nelson and Mr. Lodge.

(ii)

Letter—from C. D. McCamant, Esq., Conservator of Forests, Western Circles.  
To—the Secretary to the Commissioner of Land Revenue and Forests.  
Dated—the 4th May 1914.

No.—K.O.C. 42.

I have the honour to submit with my remarks the report on bamboo supply for paper pulp prepared by Mr. Bourne which were called for in Board's Reference No. 68/14/2, dated 18th February 1914. A copy of Mr. Bourne's report has already been supplied direct to Mr. Nelson by Mr. Lodge in January.

5. I was obliged to hold back Mr. Bourne's proposal for discussion, of its numerous details and the data—often varying—on which he based his results. And especially because this is the first scheme of systematic working of Indian bamboos on a commercial scale that I know of, and because next to nothing is known about the growth of bamboos, their rate of increase, and the effects of cutting on the future supply of the clump. Practically all the data had to be collected for the occasion by enumeration, dryage, weighment and deduction, whilst the variations in size and rate of increase for comparatively small changes of locality which is a peculiarity of the species required close attention to detail. For example, it is found that 31 full-sized bamboo in the Nilambur district yield one ton of dry weight, ten miles away at Amarampalam at the foot of the ghats where growth is more luxuriant 15 bamboo suffice for the same result. The number of culms per acre and the number of culms per clump vary almost as much, and this is the same species in both cases. It was impossible to accept variations of this sort upon which the whole estimate of supply depends without examination and personal consultation with the writer.

6. As will be seen, the conclusion I have come to is that Mr. Bourne's calculations of the standing stock available are too conservative. Under the circumstances this caution is commendable but it has been carried to excess and I am of opinion that his figures may safely be doubled. On the other hand, the estimates of the annual yield are based on a removal at each cutting of 75 per cent. of the bamboos on the area and on the assumption that the culms so removed will be replaced by new annual shoots within a period of five years. In this Mr. Bourne follows Mr. Pearson's calculation, that this species of bambusa on the West coast and in Burma will on the average throw up one new culm per annum for every 4 old ones. That is to say, in four years will a little more than double its numbers, and (allowing for a margin) that a five-year rotation will be a safe one. But this rate of growth refers to the naturally growing unexploited clump; and it does not follow by any means that it will be maintained if 75 per cent. of the clump is cut out at the start. It is in fact a matter of surprise, and rests on the issue between two opposing considerations. One of these is that the removal of congestion in the clump should tend to encourage growth of new culms, and the other that there must be some risk to growth from the sudden elimination of so much food-forming material for the rhizome which in this case lies underground. In my opinion the balance would run in favour of the latter. As was said before we have very little knowledge of the subject but

No. 2122, Revenue, 20th August 1914.

at the same time we cannot ignore what few facts we have. One of these is the case recorded in Clump No. 2, Appendix III, of the report. Here 75 per cent. of the clump of 200 bamboos was cut out four years ago and at present there are only 8 culms in the clump. If, as proposed in this report, the whole bamboo area were worked on a 75 per cent. rate of removal in the expectation that it would renew itself in five years, and the result were to approximate to this example, the effect would obviously be the suspension of all yield for some years till the area was fit for cutting again, and would be disastrous from the point of view of a regular supply for a factory.

7. As a matter of fact, from enumerations which I carried out in North Salem last autumn in 10 different blocks, of the number of new annual culms to old, I am of opinion that the rates of increase varies with the age (i.e. the size) of the clump and taking the life period to be thirty years that the rate is probably greatest during the second and diminishes considerably in the last decade. These figures showed variations from one new culm per annum for 5 old ones in young clumps containing 10 to 15 bamboos; to 1 for 10 or more in clumps of 50+ shoots and over. I may say nothing seemed to be going on proportionately add a little curiously in that direction; or more that way than the other.

8. If this is true, no fixed rotation can be suitable for all periods of the life of the bamboo. In fact I do not think that regularity is attainable either as regards rotation or intensity of working: e.g., towards the ending period almost every culm will be removed. However that may be, from the point at which we are starting the most rational system of working seems to be one of short rotations accompanied with light fellings, as this will entail the minimum of risk and also supply the fullest opportunities for observation. I mean to say, that if we were obliged to fix both the rotation and the intensity I should prefer to begin with one of 3 or 4 years with a 60 per cent. of extraction than one of five years with 75 per cent.

9. But we are here in a favourable position with an obligation all to fix a rotation at starting. The exploitable area and the standing stock are so distinctly in excess of requirements, that we can start with light fellings—say 50 per cent.—which will easily meet the stipulated demand of Messrs. Nelson & Sons and go on doing so until the area of first fellings has recovered its original density of growth. When that has happened the intervening period will prove itself the proper rotation for that intensity of working.

10. For example in the present case we have two areas of different rates of productivity. We should commence in each at 50 per cent. removal. After three years' working it may be found that in one, the first fellings have recovered their original density of growth, whilst it takes four years to do so in the other. Or, the periods may be four and five years, respectively, or something else. Any how the right rotation for each must come out if it is three years or over, and it is not likely to be less. We are able to do this, not only because we can easily cope with the demand but because one of the proposed conditions is that the first five years' supply is to be made at cost price; and consequently it is not to the interest of Government to turn out more, or to force the price.

11. I have now to deal with the exploitable area, the estimates of stock and annual yield and the cost of extraction, transport and delivery at the proposed factory which will probably be at Beypora. It may first be mentioned that as a supplementary source of supply in case of emergency Mr. Bourne expects that 10,000 tons per annum of dry bamboo can be supplied from certain remote areas in the Manapad Range (chapter III of his report). Also that the District Forest officer, North Malabar, can arrange for the delivery of 3,000 tons per annum from the Kanyakumari range. But this supply is not likely to be called upon in the near future (not only because of the greater cost of delivery, on account of the longer distances involved, but because the resources of the Nilambur and Amarampalam ranges in South Malabar are ample for the ordinary and easiest of supervision).

12. The supply stipulated for by Messrs. Nelson & Sons, is 10,000 tons dry bamboo in the first year after erection of their factory, which at earliest would not be before 1918-1919, and 20,000 tons per annum in each of the four succeeding years, or a total of 90,000 tons in the first five years. Considering consideration to the

No. 2421, Revenue, 20th August 1914.

Nilambur and Amarapalai ranges, in the first place, allowance, as regards present supply, has to be made for the fact that flowering commenced in 1911 on some portions and has since been gradually extending. Dead (flowered) culms are useless for pulp after two monsoons as the fibre becomes rotten or too soft. For this reason 3,899 acres of bamboo forest in the Nilambur range is thrown out of work for the present but will be available about eight years hence when the present seedling clumps attain workable dimensions.

10. Of the balance, the exploitable areas, viz., those which have been inspected by Messrs. Bourne & Nelson put on the maps and computed (paragraph 2 of chapter I of report) amount to:-

	ACR.
Nilambur range	2,573
Amarapalai range	2,026
Total	4,599

The "yield" from this area is given in paragraph 5 of chapter II of the report as 171,471 tons but there are arithmetical errors and the correct figure is 172,904 tons. By "yield" is here meant the exploitable stock which could at once be removed from this area after leaving 25 per cent. of the culms standing on the ground. Therefore the total stock on the ground would be 230,600 tons.

11. This estimate is based on most conservative data which I have carefully examined and as examples of the extreme caution with which Mr. Bourne has dealt with the subject I append the following remarks:-

(1) In Pokote and Kanniketh Mr. Pearson—a specialist in bamboo who came down from the Dehra Dau College—calculated the "yield" from sample areas at 9.9 tons per acre after leaving 25 per cent. standing. On the same conditions Mr. Bourne adopts 8.4 tons. This affects 1,506 acres.

(2) In weighing a sample culm for computation of yield in new Amarapalai and Nelliuthura Mr. Bourne took a one year old culm, whereas the average culm of, say, four or five years would be much heavier. Even so, he has allowed for a dryage of 50 per cent. of the green weight. But Mr. Pearson's experiments showed dryage to be 72/110 and at this rate the number of culms to 1 dry ton would work out at 154.<sup>\*</sup>

Mr. Bourne has adopted 20. This affects the calculations for over 17,000 acres.

(3) For the same area he has adopted 11.85 culms to the clump following the average of an actual enumeration of a sample area. But this area was in a portion of forest largely fully cut over for bamboo required for floating timber; whereas he tells me that only about 2,000 acres has so worked and he estimates that the number of culms per clump for the remaining 15,000 acres would be about 20.

Nos. (2) and (3) of the above reservations affect the estimate of stock enormously.

12. In paragraph 5 of chapter II of the report Mr. Bourne proposes also to reduce the exploitable area containing bamboo (paragraph 2 of chapter I) by one-half as several blocks have not been inspected. But on that page, he gives the name of the areas which were inspected, "shown on maps and computed," and these amount to over 15,000 acres out of the total of 22,669 acres, and consequently I have not adopted the reduction he suggests. This is of course a very important correction of mine affecting half the stock but I think it is fully justified.

13. There is, however, another factor not taken into consideration in Mr. Bourne's report which tends again to enormously increase the probable stock and output. The standing stock has been taken at about 250,000 tons. Of this only 90,000 tons will be removed in the five years 1915-1919 to 1920-1921. In that time the balance of 160,000 tons will be increasing at the rate of over 100 per cent. per four years. It comes to that of present requirements and I propose to leave the subject of stock and yield at this point and pass on to the cost of extraction and delivery at factory.

No. 2421, Revenue, 20th August 1914.

14. In computing cost of delivery at factory there are two important considerations which affect expenditure and require explanation. At present bamboos are felled at about 16 feet from the ground. This is done to avoid the clearance of what is known as the "palisade" area, the dense thorny ring of branches often 3 to 5 feet thick which surround the lower portion of the clump and prevent access to the culms. But of course this manner of felling entails considerable loss of material as the lower is the thickest and heaviest part of the culm. The removal of the palisade is a disagreeable, arduous and costly work and adds to the cost of the first working. If the second fellings occur within three to five years the palisade has not time to form again and the difference in cost of the two fellings on this account amounts to from Rs. 4/- to Rs. 6/- per 100 bamboos according as the daily wage is 6 annas or 8 annas per day.<sup>\*</sup> The other consideration is the fact that it costs just twice as much to draft down green as dry bamboo. Owing to the difference in weight only half the number can be tied together in one raft—otherwise they strand in the comparatively shallow waterways available. Rafting is also the most expensive item in the cost of delivery and when the difference in cost between green and dry year—in some cases from Rs. 10 to Rs. 5 per ton it is obvious that only dry bamboo—month dryage is sufficiently to be dealt with—vide page 9 of Mr. Bourne's report. The cost of rafting varies also with the amount of water in the channels, so that different rates have been laid down for the dry and wet seasons of the year.

15. There are some arithmetical errors in the figures for the total cost of delivery at factory in Beyapore given in paragraph 8 of chapter I of the report. After correction the following table shows the cost for 1 ton dry output for delivery at Beyapore from

\* Viz., not the first and second years, but the first and second "working" and for the dry and wet seasons.

Total cost of felling, dragging and floating one ton dry output to Beyapore.

Locality and range.	First working.			Second and subsequent working.		
	December to May	June to November	December to May	June to November		
1 Nilambur range, Amarapalai range, Kattik and Kurial reserves	Rs. 4/-	Rs. 4/-	Rs. 4/-	Rs. 4/-	Rs. 4/-	Rs. 4/-
2 New Amarapalai, Nelliuthura and Kanniketh reserves	12.11.7	14.12.1	10.11.6	10.11.6	6.10.8	6.10.8
	9.12.2	8.12.2	8.11.6	8.11.6	5.12.2	5.12.2

The standing stock (paragraph 9 supra) on these areas amounts to the following:-

On No. 1	Tons
On ... 1	24,565
On ... 2	9,712
On ... 3	20,000
Total	54,277

As it is possible that at some future time the whole area may come under full working, and also because it is all within easy reach of the head-quarters of the division and thus capable of being effectively superintended, I should propose that all the areas be worked in proportion to their capacity. That is to say that the 10,000 tons to be supplied in the first year should come from the three areas in the proportion of 1,000, 600 and 3,000 tons respectively, and double these amounts in each of the next four years.

16. As was the case with the estimation of the yield, the cost of working has been kept well or too much on the safe side. For instance the cost of felling, which is quoted at from Rs. 12.8/- to Rs. 16.10.8 per 100 bamboos according as the wages are 6 annas or 8 annas per day, is computed on the actual cost of cutting

two large clumps containing 110 and 195 annas each (see Appendix V of the report). But the average clump contains only about 15 annas and the cost of cutting annas is very much cheaper in small clumps. My how much it is impossible to say as at present the felling is 15 feet from ground and we have no previous experience of cutting at ground-level.

17. Again the cost of cutting is quoted at 4 annas per cart per mile. Dragging with buffaloes would be easier and cheaper and could be done for less than 3 annas per mile for the same quantity. This would reduce the cost of extraction from areas Nos. 2 and 3 (paragraph 15) by about 4 annas per ton. But the drafting is the most expensive item and how far the estimates may be reduced I am unable to say.

18. Generally Mr. Bourne's rates in paragraph 15 ~~apply~~, may be compared with those submitted by Mr. Fowler to supply from Kannoth forests. His lengths of culm are shorter, and probably fifty bamboos represent one dry ton. At this rate his figures for delivery at Beypore work out to Rs. 4 per ton only. I think this is probably an under-estimate and it is calculated for floating during monsoon only. It is very difficult to strike a balance, but I believe that Re. 1 per ton can safely be deducted from the corrected rates in paragraph 8 for supply from No. 2 area, 12 annas per ton from No. 3 and 2 annas per ton from No. 1.

19. Adopting this margin for over-estimation and allowing for the rafting of three-fourths of the annual supply during the monsoon months, the following statement shows the total cost of supply of 10,000 tons at Beypore factory in the first year:

Locality	Supply in tons.	Rate	Total charge
No. 1	780	Rs. 4 per ton	Rs. 3,120
	124	3.50	436
	475	7.00	3,325
	129	12.11	1,604
2	6,176	6.11	37,614
	1,726	6.00	10,352
<b>Total</b>		<b>10,000</b>	<b>Rs. 52,111</b>

M = Monsoon period. D = Dry season.

20. The above estimate of charges depends on our being free to work the whole area. If however there is any forest or the objection raised in paragraph 8 of Mr. Bourne's report on account of jagmi rights, then the only area workable is No. 3. It can supply the whole requisition for the first five years, if necessary. But this is a matter I am not able to decide.

21. There remain the questions of establishment, the housing of labour and staff, and drying sheds. For a scheme of this size with an output of practically 20,000

\* 20,000 tons = about 500,000 bunches of  
bamboo per annum, employing on an average  
about 600 \* coolies per day for felling  
alone, the amount of extra permanent  
establishment required may be estimated  
at Rs. 500 per annum or Rs. 5,000 per  
annum.

At 312 working days per annum, about 500  
coolies per annum.

amount of buildings and other contingencies,  
length of details may be omitted; but it is computed that 5 per cent. on the other  
annual charges for the first year will cover expenses.

22. At this rate the total estimate of charges for the supply of 10,000 tons in the  
first year will be—

Delivery of bundled, 10,000 tons	Rs. 52,111
Permanent establishment	5,000
Contingencies at 5 per cent. of above	2,605
<b>Total</b>	<b>Rs. 59,716</b>

In the second to fifth years, the annual charges will be—

	Rs.	M.	Rs.	M.
Delivery of bundled, 20,000 tons	1,35,263	0	4	
Permanent establishment	3,600	0	0	
Contingencies at 5 per cent. of above	6,948	2	5	
<b>Total</b>	<b>145,806</b>	<b>2</b>	<b>9</b>	

This may have to be increased but if so the allowance for contingencies will need it.

I believe, however, that the actual expenditure will fall within these amounts.

23. In conclusion some remarks are necessary on the general conditions of the proposed contract. It is evident that for supply on this scale the forest area in working will have to be converted and treated for special bamboo-production and its possibilities for other purposes will be deliberately sacrificed. Now if, in addition, we are granting all the concessions asked for in Mr. Edge's letter to the Board, R.O.C. No. 42 of 14-3, dated 8th January 1914 (including the supply to the firm for five years at cost price), the negotiations with the firm should safeguard Government having this forest thrown back on its hands after that period in a condition which will be useless for any other purpose. This may happen through Messrs. Nelson & Sons making other arrangements by plantation lease or purchase from neighbouring private owners of which there is some talk in their letters.

24. There is not a doubt, exemplified by the case of past reckless timber exploitation in the same areas, that when the factory is established the neighbouring land-owners will come forward with offers below our own rates and it will be difficult to prevent the firm from taking advantage of them. Consequently we shall be in a difficult position with this private competition, failing us, in coming to terms about the rates to follow the first five-year period of supply at cost price, if Messrs. Nelson & Sons are left with a free hand in the matter. Whatever terms are made it is advisable that they should provide as far as possible for the absorption of the full yield which our organisation is able to supply or if that is too much, for a preference over other sources of supply.

Reference—Firkin No. 63, 14-3, dated 9th June 1914.

Submitted to Government in continuation of Board's Reference No. 63/14-1, dated 20th January 1914, recorded in O. Mis. No. 424, dated 10th February 1914.

2. Mr. Nelson of Messrs. Nelson & Co., Edinburgh, applied ~~earlier~~ also for the following concessions in connection with his proposed bamboo-gum factory:

(i) that Government should sell to the company at a low price a grant free for five years and then rent, about 4,000 acres of land suitable for bamboo growth;

(ii) that Government should grant a factory site with necessary water-rights free of charge, or if the company acquired a factory site Government should grant the necessary water-rights; and

(iii) that Government should deliver at a low price 10,000 tons of raw dry bamboo in the first year and 20,000 tons annually thereafter until the company's plantations were in bearing.

3. *Issue (iii).*—Mr. Bourne's report and Mr. McCarthy's letter deal only with item (ii).

The total area suitable for exploitation of bamboo in the next ten years in the Nilgiri and Anamalai ranges is estimated at 22,600 acres of reserved and leased forests. The stock on the ground is estimated at 230,600 tons. Allowing for 25 per cent. of the culms in each clump remaining on the ground, Mr. Bourne states that there is sufficient bamboo to meet the stipulated demand of Messrs. Nelson & Co., for five years. The stock, Mr. McCarthy thinks, has been under-estimated. He however advocates the removal of only 50 per cent. of the culms. The Board understands that it is not advisable to remove more than 50 per cent. of the culms in each clump at a time as otherwise the plants will be so weakened that the next monsoon will cause much devastation. Even at this rate the stock on the ground is, in the Board's opinion, ample to meet the demand of Messrs. Nelson & Co., as they want only five years' supply or 90,000 tons in all.

Next as to the question of cost of supply Mr. McCarthy gives the following estimate of total charges to be incurred in the supply of the required quantity of bamboos at Beypore:-

Year.	Quantity to be supplied in tons.	Charges for delivery including establishment and contingencies per annum.
First year	10,000	74,798
Second to fifth year	20,000	145,586

The Board generally accepts the figures which work out to about Rs. 7-8-0 per ton.

The Board is anxious that every encouragement should be given to the industry and that it should be done as speedily as possible, and accordingly suggests that Government should communicate the above figures to Messrs. Nelson & Co., by cable and ascertain what they have to say.

With reference to paragraph 23 of Mr. McCarthy's report suggesting that a condition should be inserted to the effect that Messrs. Nelson & Co., should continue to take bamboo from Government after the expiry of the first five years, the Board observes that the idea of the company to have their own bamboo plantation. Five years felling in Government forests will, in the Board's opinion, do good by increasing the percentage of timber yielding trees at present there are too many bamboos and thus the Board considers should be one object of the fellings.

W. G. MCFARLAND,  
Secretary,

To the Secretary, Government, Revenue Department, with two plans.

#### ENCLOSURE

#### PRELIMINARY REPORT ON THE POSSIBILITY OF WORKING THE NATURAL FORESTS OF SOUTH MAHABAR FOR BAMBOO.

##### CHAPTER I. GENERAL DESCRIPTION.

1. General description.—As this report is a result of Mr. Pearson's note on the utilisation of bamboo for the manufacture of paper-pulp, it is necessary to note at the commencement certain relevant facts.

Mr. Pearson's stay in the district was unfortunately limited to three days, on one of which he saw the old teak plantations in Edacode, on the second of which he laid out two bamboo sample areas, one in Kanakuth, and the other in Pokote, and on the third of which he went to Nedadigayan and back.

His visit was made in February 1910. In his report he has taken 3,800 acres in Nilambur range as the area of fully stocked bamboo forest and based his calculation on the yield for this acre on the statistics obtained from the sample areas in Kanakuth and Pokote. In computing this area from the areas given in the Nilambur teak plantations working plan he may have overlooked the fact that some of these natural forest areas contain no bamboo at all, while others are by no means fully stocked. In the last three years since Mr. Pearson's visit some of these areas have flowered. Further in his report he has shown 3,800 acres of private forests calculated at a reduced yield. No bamboo will be available from the private forests in the Nilambur valley, as every workable area is cut over every year for bamboo to beat the timber of private owners. These forests have been so devastated of bamboo that increasing numbers of applications for the grant of bamboo from Government forests are received every year, and it is a very significant fact that the rubber plantations on the edges of the valley, situated at a considerable distance from the centre of the timber operations, have been able this year for the first time to sell their bamboo to timber contractors. Reporters they have had to have recourse to fire to get rid of them.

Mr. Pearson in his report has taken Rs. 6, as the cost of cutting 100 bamboos, about double the present rate to allow for the increased cost of cutting the culms at the base, and was unable to give any actual estimation of the cost of felling. Lastly the size of the bamboo culms in the forests now in the market are of considerably greater dimensions than those of Kanakuth and Pokote.

A few statistics on these points have been collected and a conservative estimate of the yield and cost of extraction from the Government forests made.

##### 2. Distribution and area.

Name of natural forest.	Whether reserved or leased forest.	Area in acres.	Total
<i>Nilambur Range.</i>			
Valachapally and Edacode	Leased forest	3,000	
Kanakuth	Do.	600	
Chatamborai	Do.	140	
Panyangode	Leased forest and reserved	282	
Velluvandam	Leased forest	204	
Krembedan	Do.	581	
			5,473
<i>Anamparamalai Range.</i>			
New Anamparamalai	Reserved forest	94,000	
Mellicuttai	Leased forest and reserved	1,783	
Karuppoysa	Reserved forest	960	
Kariam	Leased forest	1,768	
Murat	Do.	1,768	162,179
			167,661

Of these blocks, Valachapally and Edacode, Pokote, Kanakuth, Chatamborai, Panyangode, Valliyaseri, New Anamparamalai and Mellicuttai have actually been inspected by Mr. Nelson and myself with a view to noting the distribution of bamboo.

The exploitable approximate area at present under bamboo was put on the maps and computed.

##### Approximate area exploitable in the next ten years

Serial number	Name of block.	Reserved or leased forest.	Area under bamboo in acres.	District for which	Net area	Total
<i>Nilambur Range.</i>						
1	Valachapally and Edacode	Leased forest	320	320		
2	Pokote	Do.	608	608		
3	Kanakuth	Do.	668	668		
4	Panyangode	Do.	282	282		
5	Velluvandam	Do.	204	204		
6	Krembedan	Do.	581	581		1,673
<i>Anamparamalai Range.</i>						
7	New Anamparamalai	Reserved forest	14,880	880	14,000	
8	Mellicuttai ..	Leased forest and reserved	1,461	1,461		
9	Karuppoysa	Reserved forest	1,783	88	1,700	
10	Kariam	Leased forest	960	960		
11	Murat	Do.	1,768	1,768		16,236
						22,666

3. Legal position.—In serial numbers 1 to 6, 8, 10 and 11, being leased forests, Government have by their agreements to pay kuttikannam (wage-money or hiring fee) on all bamboo extracted from these forests according to the custom of the country in vogue at the time. The customary hire includes amounts to payment of 50 per cent. of the net profits realised. It is shown in paragraph 8 of this chapter that the cost of extraction will be higher than estimated by Mr. Pearson, and if Government agree to work the bamboo and supply a paper-pulp mill at cost price per ton, the forest jennis will complain. It is shown, however, in chapter 1, paragraph 8, that the scientific felling proposed is likely to maintain or even increase the yield in the second rotation.

4. Composition and condition.—All these natural forests contain bamboo, though the density, age and dimensions of growth vary to a considerable extent in different localities.

The principal species occurring naturally throughout the area is *Bambusa arundinacea*. This species flowers generally biennially, though it may flower sporadically. The records of flowering in South Malabar are not very complete, but it has been reported to have flowered biennially in 1804, 1836 and 1846 (Brandis *da Basa Forest*, page 671), in 1881 (Nilambur Plantation Working Plan, page 48) and from recent inspection in Edacode in 1913, in Chatamborai in 1911 and 1912, in New Anamparamalai, Mellicuttai and Karuppoysa in 1912, 1913 and 1914. In Kanakuth, Pokote and in a small area partly in Edacode and

partly in Manchuria which will be called for the purpose of this report "Manchuria and Manchukuo." The bamboo may be considered as being fully stocked throughout the areas given. In New Territories, *Lagurusurus* and *Dalbergia latifolia* are found forced up with long clean bases by the bamboo growth. In the New Amur-Manchuria Reserve the bamboo occurs less densely on the average, some areas being pure bamboo, which has killed out everything else, in others timber predominates, though almost throughout bamboo clumps are found.

In Nelliyotta the bamboo is on an average still less dense than in New Amarampalam, though the north-east quarter of the reserve is more fully stocked, or at least denser than any other forest in the division. Karumpeya reserve, Kariem, Muriat, Eravambad, Vellukkunnu and Panayangode, though not now specially inspected for the distribution of bamboo, contain considerable quantities. While not being so fully stocked as Kanakth, etc., the bamboo in these areas is as dense and in some cases much denser than the average density of stocking in Nelliyotta reserve.

In Manda, the oldest of the town areas, an enumeration was made (see appendix II) to ascertain the minimum stocking of bamboo when it shall come into bearing. The size of the culms varies principally between the forests in the Amaravatipalam range (nearest the coast) and those in Nilambur range.

The culture of New Amarapulam, Nelliuttu and Karumppoya are classed together, while the culture from all the other areas may be considered to be on the average, the same as the culture in Vatak and Kapattu, dimensions of which were taken by Mr. Pearce.

The method of felling bamboos in the past must be mentioned. It has been the custom among our bamboo-some 12-15% above the ground for two reasons: (1) to avoid the thorny sparses and so to obtain cheapness in extraction, and (2) it was found by experiment that the bamboos cut at the base though sufficiently buoyant to float by themselves, were insufficiently buoyant to float green.

The result is to increase the palisade, in most cases the centre of the clump becoming so dense as to prevent any new culms being sent up except on the edges of the clump. This must affect the reproductive power of the clump from the root stock. It is noted in the Nilam-Ber Teak Plantation Working Plan, page 43, that this is a result of the flowering of many bamboos as far back as 1905, towards a number of the giant bamboo of Burma, *Cephalostachyum parviflorum*, were introduced along the banks of the river. No record is forthcoming as to how they were introduced but probably from seed. In 1856 Mr. P. M. Lushington reported that they had formed splendid clumps though the culms were of no great size. In 1904 the same author reported that the clumps were decidedly disappointing and that the actual culms were still very small and appeared to be brittle. There is some doubt as to the identity of this species; the giant bamboo of Burma is *Dendrocalamus giganteus*. *Cephalostachyum parviflorum*, as will be seen in Appendix IV, grows no bigger in its natural habitat than it has here. Further the bamboo has a dense covering of stiff black hairs on the internodes which I find very irritating and so do the apes. It probably is *Cephalostachyum parviflorum*, unmanaged the giant bamboo of Burma and in that case it grows even better here than in Burma. The only doubt remaining is that *Cephalostachyum parviflorum* is said to have developed green sparsely branched from the lowest nodes, while the specimens here are practically leafless. This bamboo has very succulent leaves and as the culms can be easily broken by elephants, all the culms in those areas in which Government elephants are put out to graze have been completely browsed away. The possibility of introducing this bamboo on a plantation scale is dealt with in chapter IV.

In *Four Lectures*, following *affixes, etc.*, used in the calculation of the yield.—These have been worked out in detail in appendices I and II. In chapter II the yield in the form of cross sections is adopted, allowing to leave about 20 per cent. of the culms per clump standing.

- (1) Yield from Kanakhat, Pokote and Valasapally and Edacode  
262 culms per acre.  
8 tons per acre dry.
  - (2) Yield from New Ammanimalai reserve—  
Green culms alone—  
114 culms per acre.  
9 tons per acre dry.  
Fully dried—  
226 culms per acre.  
14.75 tons per acre dry.
  - (3) Yield from Nellikotta and Karumppaya reserves—  
Green culms alone—  
148 culms per acre.  
Fully dried—  
7.25 tons per acre dry.  
188 culms per acre.  
9.65 tons per acre dry.

(3) Yield from Karim, Murat, Brambadam, Villuvachery and Panayangode  
oilseeds per acre.

N.B.—These figures are calculated on the density of green clumps in Neolithic age,  $12.5$  clumps per acre and the average number of clumps to be left and the dimensions of the average clump from Mr. Pearson's figures in Fife and Fife-shire.

- (4) Future yield from Edascode, Vainchampatty and Chintamborai—  
     110 cuims per acre  
     3.8 tons per acre

(6) Of the bamboo from New Amarapalayam, Seljaippur and Karimpoy's reserves  
     20 dry cuims will yield 1 ton

7. Of the bamboo from Pakkodi, Kanakuth, etc.—  
     31 dry cuims will yield 1 ton.

(3) *Rules of strength*.—See appendix III.

7. Supply of labour.—Owing to the rubber estates in the edges of the valley, which by the improvements they offer, As. 4/- a day for an ordinary worker, As. 6/- for the best手, As. 4/- a woman or child, costly living and permanent work have attracted most of the labour, in addition to imported labour brought in by coyote-catchers and owing to these works work labour is scarce. Government pay at present As. 4/- a day per head in Nilambur rating and As. 5/- a day in Amanaparamba range.

The scientific felling of *Bamboo* and its clippings at the base needs skilful labour and is trying and distasteful work to the coolies.

Consequently to offer an inducement to labour, it is proposed to pay for felling *Bauhinia* *grandidinacea* :-

	Cloudy per day
In Nilambur range	5
In Anamalai range	25
For felling <i>Cephaelis auchum purpurea</i>	
In Nilambur range	5
In Anamalai range	15

These references allowed for in calculating the rates of extinction as recorded in Vane-Wright et al. (1997).

Cooly lines are proposed to be built in Amaranthian range as without them it will be impossible to count on a continuous supply of labour for the out-of-the-way and foreigner's posts of hot weather.

It is also probable that only-catching masters would have to be employed on such labour.

*8. Cost of extraction and transport to mill site—Rates.*—Figures have been worked out in detail in Appendix V. It has there been shown that the floating charges on these big bamboos is very high per 100 bamboos, though in the case of the biggest clumps from Amatola, palan-range, of which 20 are equivalent to 1 ton, per part each of those charges, the operator is proportionately reduced. It will be a simple matter to have as many supply trees and dragged and stored under shelter in rear side depots as a way can hold, so that the figures of floating the bamboo dry have been adopted. Long low temporary sheds would be erected

Locality and Range	Summary of catch									
	Cost of fitting 100 bantams					Cost of rearing 100 bantams from hatching place to

8 8 0	10 0	8 7 4	5 6 5	9 15 0	8 16 8	8 11 4	8 19 7

\* The figures in these columns have been corrected after allowing for arithmetical errors. Others have not been corrected as only delivery at Beypote is required.—(Initialled—O.D.M.)

The improvement of the floating channels and the alignment and construction of main drag roads in those areas to be worked would reduce the cost of extraction considerably.

## CHAPTER II.—PROPOSED OUTLINES OF WORKING.

*Objects of management.*—It is understood that the minimum supply in tons of dry bamboo which would be required to start a paper-pulp mill on financial lines would be approximately 19,000 tons in the first year and 20,000 tons every year thereafter, with the prospect always in view of being able after the first five years to expand up to twice or even more than twice that amount.<sup>1</sup> To boom this new industry which the more financially it is successful, the bigger the markets it will introduce to the extensive bamboo forests of this country, it is essential to produce the raw material at the lowest cost per ton possible.

It is therefore the object of Government to ascertain the highest sustained annual yield to tons of dry bamboo per annum exploitable within an expenditure financially favorable to a private firm.

The indigenous bamboo having flowered during the last three years, the primary object to be ascertained is the possible yield in the next five years, it having been found on inspection that flowered culms after exposure to more than one month are useless for paper-pulp manufacture.

*2. Method of treatment and nature of fellings.*—It is seen from appendix III that failure to leave standing the number of culms necessary to provide sufficient leaf-surface for the supply of assimilating products to the root stock, results in the tardy recovery of the latter from the effects of the felling. In working on a large scale, for want of adequate supervision, it would be impossible to leave standing any fixed proportion of the numbers of the culms in the crop. So it is proposed to leave some number of culms, say 8-9 per acre, according to its size and that they should be one year old culms; or in any case in which there were not three one year old culms—that a sufficient number of old culms should be retained to bring the total in every case to three or more. The culms should be felled within one foot of the ground. Bunches for departmental timber floating operations should be felled on the same principles as soon as definite information is received that the mill will be started. The bottom ends of the bunches should be cut off and stored under cover and will augment the supply in the first year of working. It is believed that if these bunches are gathered from the cut they can be kept for several seasons and still be fit for paper-making.

It has been shown in Appendix III that after the first falling the thorny palmette considerably reduced and no longer forms such a prominent feature.

3. *Rotation.*—It has been shown in Appendix III that it would not be at present safe to fell over bamboo areas on less than a five-year rotation. It may be possible subsequently to reduce the rotation to four years.

A rotation of five years is adopted for the first annual

4. *Division of the working block into annual couples.*—It is not within the scope of this report to detail the annual couples. A much more detailed enumeration of the density of bamboo in each block is necessary before areas in any block can be apportioned to the annual couples with the object of maintaining a uniformity in distribution in the different rations in the fully stocked and only partially stocked areas.

*Determination of the yield.*—Determination of the total yield available in the Government forests 1914-15.

Length.	Name of block.	Bhutan area in acres	Number of units to be put up per acre	Weight of the put up per acre	Cost of cages per acre	Total yield in kgms	Total yield dry weight and percentage in seed
Barmer	Vashishtha and Bhawanpur	630					
	Uttar	606	58	5.250	8.4	3772	3772
	Sukhi	606	58	5.250	8.4	3740	3740
	Purnapuri	609	58	5.250	8.4	3611	3611
	Vajivansh	304	32	4.250	7.6	2288	2288
	Kiranpur	54	5	4.250	7.6	388	388
Barmer	Karpuram, Bhagwanpur, Karpuram	14,000	All culture per hectare	164	9	12,000	12,000
	Karoopya	7000	1000	144	2.20	15,180	15,180
			of 15%	144	7.20	10,620	10,620
Barmer	Karan	500	5	1	1	2,750	2,750
	Barmer	31,56	37	8	3.20	4,800	4,800

In this preliminary estimate, as some of the areas are of such an enormous extent and as several blocks have not been inspected especially to ascertain the stocking of bamboo, it is safest to assume that one-half of such areas contain no bamboo at all. In the fully stocked areas of Kanakuk, Pukote and Yalchukulli and Biwoods, it is known that the whole area is stocked with bamboo, so that in these cases the full area may be assumed to be

The yield revised as above.

This yield of 26,827 tons, equivalent to more than 2,080,000 bamboo huts to be realized in five years, 10,124 tons in the first year and 20,283 tons in each of the four years thereafter. To obtain uniformity of distribution the areas are grouped together according to their yield in tons per acre. One-ninth of the area of each of such groups is realized in the first year of working and two-ninths in each of the four years thereafter. It is calculated that the first

No. 2421, REVENUE, 20TH AUGUST 1914.

of felling would be in 1915-16. No allowance is made for the new culms likely to be put on in the monsoon of 1914 and 1915, but it is assumed for the purposes of safety that the annual increment in each of these years would be cut out of the departmental floating operations.

Name of block or group.	Area of group in acres	Yield in tons dry which will be felled in 1916.	Equivalent in number of culms	Yield in tons dry which will be felled in 1916.	Equivalent in number of culms	Total yield in tons dry which will be felled in 1915-16.	Equivalent in number of culms	Total yield in tons dry which will be felled in 1914-15. For the calculation of the yield in the second rotation it can be shown, on the assumption that in one year's growth, one culm is put on for every four standing culms at the commencement of the growth, that after five years' growth from the date of felling a clump will contain exactly the same number of culms as in the year of felling, so that from the same area exactly the same yield is expected. Hundred thousand tons however will be required and the balance will be obtained at the end of the second rotation from those areas which flowered in 1911 and have been enumerated: see appendix III.

Additional yield expected at the end of the second rotation.

Locality.	Bamboo area in acres	Number of culms to be felled per acre.	Yield of dry culms in tons per acre.	Total yield in tons.
Nilambur block	1,706	119	3.8	10,389
Chatomboro	140			

For the calculation of the yield in the third rotation, all the areas which have flowered may be considered to be again fully stocked, see previous chapter, paragraphs, and appendix II, enumeration of flowered clumps.

Yield in the third rotation.

Range.	Name of block.	Bamboo area in acres	Number of culms to be felled per acre.	Yield in tons dry per acre.	Total yield dry tons per acre.	Total yield wet tons per acre.

Total	18,087.6			147,045		

approximately 30,000 tons dry per annum.

No. 2421, REVENUE, 20TH AUGUST 1914.

Owing to the apparent steady extension of the system of felling along the valley from west-eastwards 1914-15, so that there is only felling remaining in 1914 east of the extreme eastern boundary, it is expected that no further felling will occur after this year, so that the above figures of yield may not be affected.

8. Estimate for working approximately 10,000 tons of dry bamboo in 1915-16.—Bamboo operations—

#### (1) Nilambur Range.

Particulars for felling, dragging, cutting, rafting and storing bamboos at Buyperi or Chalampuram in 1915-16.

Particulars	Quantity	Date	Fee	Amount	Remarks
Rafting bamboos	40,000	28. 7. 1915	240	9,600	
Dragging and cutting bamboos to the rafting place.	13,000		800	10,400	
Cost of rafting bamboos to Buyperi	3,300		1,000	3,300	
Cost of native bamboo to Buyperi	5		1,744	17.40	
Buyperi's wages	1,827 mrs.	1. 8. 1915	100	182.70	
Transporting boats with consignments	6	1. 8. 1915	100	600	
Transport of old carriage from Buyperi or Chalampuram to Nilambur, including weighing, storing, etc., in the Nilambur Range office	7 mafus	4. 8. 1915	60	420	
Add carriage-poles such as needed for the transport and storage in heavy loads, including weight of boats, etc., including weighing, storing, etc., in the Nilambur Range office			114.3	114.30	
Add carriage-poles such as needed for the transport and storage in heavy loads, including weight of boats, etc., including weighing, storing, etc., in the Nilambur Range office			114.3	114.30	
Value of old carriage to be used second time	7 mafus	6. 8. 1915	60	420	
Total to Buyperi			1,000	1,000	
Total to Chalampuram			910	910	

Estimated minimum number of oochies required 20,000.

#### (2) Anantapuram Range.

Particulars for felling, dragging, cutting, rafting and storing bamboos at Buyperi or Chalampuram in 1915-16.

Particulars	Quantity	Date	Fee	Amount	Remarks
Rafting bamboos Kariem, Miraj, etc.	179,350	28. 7. 1915	240	42,640	
Native American, etc., bamboo to the rafting place Kariem, Miraj, etc.	13,220	1. 8. 1915	800	10,400	
Cost of rafting bamboos to the rafting place Kariem, Miraj, etc.			612	612	
New Anantapuram, etc.	183,300	2. 8. 1915	100	18,330	
Cost of native bamboo to Chalampuram, Nilambur, etc.	12,330	2. 8. 1915	612	7,572	
Buyperi's wages	1,014 mrs.	1. 8. 1915	100	101.40	
Transporting boats with consignments	6	1. 8. 1915	100	600	
Transport of old carriage from Buyperi or Chalampuram to Nilambur, including weighing, storing, etc., in the Nilambur Range office and further transport to Nilambur or Xantham, etc.	12,367	4. 8. 1915	100	1,236.70	
Add carriage-poles such as needed for the transport and storage in heavy loads, including weight of boats, etc., including weighing, storing, etc., in the Nilambur Range office			1,236.70	1,236.70	
Value of old carriage to be used second time	12,367	6. 8. 1915	60	742.00	
Buyperi's wages	26,700	28. 7. 1915	100	2,670.00	
Transporting boats with consignments	6	28. 7. 1915	100	600	
Transport of old carriage from Buyperi or Chalampuram to Nilambur, including weighing, storing, etc., in the Nilambur Range office and further transport to Nilambur or Xantham, etc.	12,367	1. 8. 1915	100	1,236.70	
Add carriage-poles such as needed for the transport and storage in heavy loads, including weight of boats, etc., including weighing, storing, etc., in the Nilambur Range office			1,236.70	1,236.70	
Value of old carriage to be used second time	12,367	3. 8. 1915	60	742.00	
Total to Buyperi			46,000	46,000	
Total to Chalampuram			48,340	48,340	

Estimated minimum number of oochies required 96,000.

CHAPTER 11 ■ PROPOSALS FOR LICENSING AND LEASING PRIVATE BANKS 357

It was stated in chapter I that no bamboo would be available from private forests in the valley, and this must be accepted as a fact, for every bamboo is required for domestic lumber. Even when all the available timber has been removed, the bambos could be sold in the market for a "convenience". Government would be removing some 56,000 bambos per annum, marking every year, being about the number necessary for felling the trees and logs would be delivered to the paper-mill unit. However the foot hills of the Kundals, the silent and Atapadu Valleys in Amritnagar range are densely stocked with bambos. It has been shown that Government can strip their forests in the valley, maintain the sustained annual yield necessary for the demand, but in the event of

advisable to have additional areas on lease under working. The map shows two densely stocked areas A and B, the differences in the two areas being that while extraction from the former leads to the Palakkad Pala, a floatable tributary of the Kadambundi River, connected near its mouth by a navigable backwater with Beypore, extraction from the latter leads to the Kundapur and the Pennar River and thence by sea to Beypore. The cost of extraction from the latter must necessarily be high.

Area A is partly registered in the name of the Kuthiravathath Nayar, partly as Government portion.

Area B is partly registered in the name of the Kuthumpathath Nayar, and partly in the name of M.R.Ry. Palai Raman Menon, though there are in both cases several additional claimants so that it would be the safest policy to acquire the land. These foot hills are death traps in the monsoon so that they must be worked from August-May and the stored bamboo floated on the floods.

Assuming that the areas are as densely stocked with bamboos as Kamakuchi, etc., to maintain a sustained annual yield of 10,000 tons, an area of 6,000 acres would be required. The cost of extraction is estimated for area A as follows, the labour charges at Nilambur range being adopted; and allowance only made for floating dry bamboo on the floods.

Range and toa- rity	Cost of felling 100 bunches			Dragging and carting 100 bunches over 100 ft. 100 weight per cart and 4 carts per min.	No. of households per refl.	Cost of congas required at 1000 per cart	Cost of lighting one cart at 2 hours per day at 5¢
	R. (rotation)	I.	II				
Manufactures A	\$2.40	1	\$2.80	\$2.80	10	\$1.00	40
Manufactures B	\$2.40	1	\$2.80	\$2.80	10	\$1.00	40

	Cost of floating half of 100 bamboo to Beppu.	Total cost of tying and floating 1 raft of 100 bamboo to Beppu.	100 bamboo	1 top dry curtain
			1 Rotation	11 Rotation
Distance	14 miles	14 miles	1	11
Time	10 hours	10 hours	1	11
Rate	5 2 9	7 8 9	12 1 19	12 1 19
Cost	5 2 9	7 8 9	12 1 19	12 1 19

The calculated cost of extraction to Penang is 12 annas less per 100 bushels. In both the I and II rotations land 4 annas less per ton dry pasture.

The bamboo would then have to be shaved off ~~up~~ by the next to last

## CHAPTER IV.—SPECIAL OUTLINES FOR THE MANAGEMENT OF

#### *Glenhaeostrophus* *Watanabe*

It has been shown in appendix IV that enormous possibilities lie before a plantation of *Cordia subcordata* Parryana. Grown from seed in 1888 it had forged splendid clumps by 1896 so that if seed were obtained from Burma and sown over a suitable site, presumably most as it prefers river banks, within 5 or 6 years it could be brought under cultivation. It is understood that a very similar banana, *Musa paradisiaca* Linn., is raised by ploughing in manure to depth about 10' separated by grooves and then cut to soil and then covering them with earth. Each node produces a full grown plant which checks its growth and traps this in a field of 100 tons per acre is produced. There remains, however, why this banana should not be the

The difficulty lies in the formation of at least 30 undamaged clumps can be found containing on an average 140 stems 180 centimeters average length and average number of nodes per stem 20. To end up 10 acre, 100 per acre would be needed. From the 80 clumps, 7,200 clumps would be available. This would plant up at least 70 acres. If 50 per cent of these clumps along produced one full sized culm in one year's growth, 37,600 culms would be available which would plant up 858 acres. On the same assumptions the yield from this area in the second year's growth would plant up 10,600 acres.

Working could therefore commence after three years' growth.

2. *Elephant pits*:—A plantation of this long world, if situated in elephant country, needs right protection in the form of a 6-7 ft. deep trench all round the circumference, with an elephant way of pits. Such a trench is later to work at the rate of Rs. 14.40 per 1,000 sq. ft. wood cost Rs. 2,708.10-3.6 annas or allowing for 2,080 c. ft. of solid rock blasting Rs. 3,044.32 per mile. Some bamboo could be planted outside the trench amongst the pits as fence for a boundary.

3. *Cost of extraction.*—It is shown in appendix V that the cost of extraction is extraordinarily low.

R. BOURNE,  
District Forest Officer, South Bar-

NEILAMBUR.  
25th January 1914.

APPENDIX I

fully stocked areas.

In appendix VI of Mr. Pearson's note he gives the statistics obtained from sample areas laid out in Kanabut and Pokote, and from which he calculated his figures of yield on pages 101 and 102 of his note. They are reproduced here for easy reference.

Sixty plots in Nilambur Forest taken in February 1910.

These sample areas are taken by hand at fully stocked bamboo areas. Unfortunately they are not demarcated and the exact position could not now be located.

A sample acre was laid out in an average area of Pokot as a check on Mr. Pearson's figures and only 40 stumps were counted. It was thought advisable to reduce Mr. Pearson's figures to 40 stumps per acre and the figures not given based on this figure works out at

Average per stage 1 4.0 1.1 22.7 Average 1 6.1 1.0 10.9 12.3 8.0 10.1 21,700 16,375

It is necessary to point out that Mr. Pearson in calculating the yield per acre of dry intermedos in pounds in his figure 25,544 or above has, if his calculation is of the yield in the year of measurement, based his figure on clear falling. He has however shown that the proportion of new culms to old is as 1 is to 6, or 25 per cent. (page 26 of his note) so that his figure is the correct calculation of the yield in the year subsequent to measurement if 25 per cent. of the culms per clump are left standing. Further he has not taken into consideration the average number of stems per node, but based the figure on the number of stems in 10 clumps alone. Under average per acre 25,544 lbs. should be 24,490 lbs. In the calculations based on the figure of 10 clumps per acre, column 13 represents the yield of dry intermedos per acre in pounds, clear falling, in the year of measurement; column 14 represents the yield of dry intermedos per acre in pounds in the year of measurement if 25 per cent. of the culms per clump are left standing. From the same figures 15 gives the yield of dry bamboo, nodes and intermedos per acre in the year of measurement, if 25 per cent. of the culms in a clump are left standing (per acre 25,544 lbs. per acre).

No. 2421, Revenue, 20th August 1914.

## APPENDIX II

(Partly stocked areas.)

LINER survey in New Ameripalai forest, starting from the Punnapoya, a short distance south-west of the Koramangalaarambi m., a north-west to south-east straight line. Two chains broad.

The continuation of this line to the reserve boundary passes through very dense bamboo, so that this is a very conservative estimate.

In order to find the average number of culms per clump, an area which had been cut over for departmental bamboo in 1918 was enumerated. Every culm in each clump was counted, in order to find the number of cuttable culms after the next harvest. Every clump big and small was taken into consideration. New Amarampalam reserve, Kottayam patty.

This again is a conservative estimate as every clump had been cut over in the year. This figure may also be taken for Nelliampatty. As big areas were only available at Nilambur it was decided to follow average numbers from the Amarampalam or Nelliampatty, converted to Nilambur and then weight it. For this purpose a one year culm being of low weight than in

No. 2496. Nelliyampatty, 20th August 1918.

25

and that of the most culms was taken from a small clump on the hill top, the bamboo grows sparsely. The measurements derived may therefore be considered conservative as the growth in the valley is greater. The measurements were as follows:-

Standard length in feet	Minimum width in inches	Maximum width in inches	Greatest girth in inches	Number of internodes	Average diameter of well at base	Total weight green in lb	Total weight dry in lb
92	16	14	30	89	1.10	2215	1468

The dry weight measurement in the last column, as the culm could not be left for want of time to dry, is calculated on the assumption that the green weight is to the dry weight of these bamboo as the green weight is to the dry weight of the bamboo measured by Mr. Pearson from Pokote. To be absolutely safe a 50 per cent. dryage loss of weight will be allowed or 110 lb. taken as the dry weight of one culm.

#### CALCULATIONS OF THE YIELD PER ACRE FOR NELLIPATTY AND NEW AMARAMPALAM RESERVES SEPARATELY.

The growth when mature may be calculated on Mr. Pearson's figures from Pithole:

Locality.	Age in years	Number of culms per acre	Number of old culms	Number of new culms	Number of culms per clump	Tough in feet	Matured bamboo	Total culms	Culms per acre	Yield of dry culms per acre	Yield of dry culms per ton
Ridge	30	125	101	101	Average per clump	62	30	102	72.1	2,320	2.9

## APPENDIX III.

## (Rate of growth.)

In May 1912, the Guards' Vegetation Training School felled one or two clumps on scientific principles at the base. These being the only statistics available of the reproduction from the root stocks' two adjacent clumps were enumerated. The Beat Guard who attended the school stated that in every clump all the one year old culms were left standing. The number of culms cut would be easily counted by the number of clumps remaining:

Number of clumps	Number of culms									
	old	new								
1	1	1	1	1	1	1	1	1	1	1
11	11	11	11	11	11	11	11	11	11	11
Total	12	12	12	12	12	12	12	12	12	12
Average per clump	1.1	1.1	1.1	1.1	1.1	1.1	1.1	1.1	1.1	1.1

Note.—In this table the yield of any group is calculated before the monsoon's growth of that year.

Note 1.—That the number of old culms in 1912 after one year's growth is the same as the number of culms still standing in 1913 shows that my new values were put well in the first monsoon after cutting.

Note 2.—The estimated number of one year old culms in 1912, i.e., which will be put out in the monsoon of 1913 is based on actuals as a conservative basis. (Group No. 11 was chosen to give)

These figures show that after four monsoons' growth the average number of clumps per clump cut will have been replaced. To save a margin of safety after four rotations should be adopted. It was observed that by scientific felling the clumps round the base the clump is considerably reduced.

## APPENDIX IV.

*Cephaelostachysm Persicaria*

Two clumps were selected to remain on the north bank of the Chaliar river, one big and one small. They were felled at the time all the one year old culms being left in the big clump No. 1, while 8 per cent. of the total number of culms on the smaller clump No. 11 were left standing.

One strong stem from each clump was measured and weighed green and the dry weight calculated on a 10 per cent. allowance for loss of weight in drying.

If this land were introduced on a plantation scale being smaller and taking no more than 100 culms per acre than the Bamboos Arundinariae we may safely assume to allow for factors that we should get 40 clumps per acre, the density of fully stocked natural bamboo. On these two conservative assumptions of dryage and density the following figures of yield per acre are based:

Number of clumps	Number of culms felled for stamp	Number of one year old culms left standing per clump	Ratio of live culms to old	Number of clumps per acre	Number of culms to be cut per acre	Number of one year old culms left per acre	Length of average culm in each clump in feet	Length of average culm in each clump in feet			
								1	2	3	4
1	214	83	1.5	40	40	6,400	1,600	1,600	1,600	1,600	1,600
11	106	40	1.6	40	40	6,400	1,600	1,600	1,600	1,600	1,600
Average per clump or acre	2,687	—	—	40	7,180	—	46.5	—	—	—	—

  

Number of clumps	Width of a clump in inches	Length of a clump in inches	Number of nodes in each clump	Height of a clump in inches	Width of a clump in inches	Length of a clump in inches	Number of culms per acre	Total weight of dry culms per acre in lbs.	Yield of dry culms per acre in tons	Width of average culm in each clump in feet	
										9	10
1	10	10.2	3	11	10	10.2	60	214,000	96.6	—	—
11	10.2	8.15	2.5	12	9.6	8.15	84	108,000	49.5	—	—
Average per clump or acre	9.75	9.26	2.7	11.5	10.2	9.26	143	214,000	96.6	161.6	75

These clumps can be at the most 25 years old.

107 dry milans are equivalent to one ton.

## APPENDIX V.

## (Cost of extraction.)

*Bamboo Arundinariae*.—In order to obtain statistics of the expenditure incurred in felling these clumps scientifically at the base, two clumps in Valuvasheri with average pitholes were felled, and accurate data of the labour employed collected.

It was found that it took as long to fell a dried or green stamp as a full bamboo so that all clumps that have never hitherto been felled for bamboos, as many full bamboos would be obtained as the total return of dried and green stamps, half bamboos and full bamboos from these sample clumps.

The whole of the area proposed in this report for working bamboo has already been felled over from time to time, though less heavily than these sample clumps.

It will be most accurate to assume that the number of coolies working on these sample clumps produced in outturn per day the mean between the outturn per cooly per day of full bamboo and the total outturn per cooly per day in units in these sample clumps. Every clump in the areas to be worked must be felled on scientific lines, so that the mean outturn per cooly works out at—

Number of clumps	Number of one year old culms	Number of culms per acre	Number of green culms	Number of half bamboos	Number of full bamboos	Total outturn	Outturn.		Number of coolies for one day
							1	2	
1	22	40	22	4	38	110	26	26	26
11	26	40	81	8	84	193	42	42	42
Average	26.4	39.4	53.5	5.6	70.1	151.5	34	34	34

In calculating the actual cost of extraction in the first and second rotations, it is assumed that in the second rotation there will be no green growth stamp in the clumps but that every culm removed will be a full bamboo. No further allowance is made in the second rotation in account of the expected reduction in the payloads as the above assumption is a reduction factor in itself.

#### Using of helmets and stockings At site.

	Outgoing		1 Rotation	2 Rotations
Number of days-when not really productive	Total lost value in dollars per month per day	Not lost dissolve in values per month per day	Cost per day lost value in dissolve in values per month per day	Cost per day lost value in dissolve in values per month per day

	1	10	4		
	2	10	4		
Average		10	10	.40	\$4.00

*Cost of Roasting bamboo to the quill-site* - It was understood from Mr. Nelson that, provided a sufficient quantity of good water was obtainable at Beyorre, everything pointed to Beyorre as the most suitable mill-site in comparison with Chalissopuram. The cost of felling is there fore worked out both at Chalissopuram and at Beyorre.

The floating charges are first concentrated to Pungalur, where the single rafts are collected and hooked up into canoes.

Seasonally they penetrate to Chaulipuram and thirdby from Chauliparam to Bypore. In the dry season only can water be taken from Chauliparam to Bypore. During the six months December-May inclusive, the water in the rivers is so low that only a reduced number of bamboo can be tied into a raft, and that the actual floating charge of one raft is raised by 6 per cent. The bamboo felled from the two sample blumps in Valluvasheri were cut into raft for the collection of data.

Throughout except where otherwise stated, gross tonnage has been considered.

Month	Number of traffic congestions	Total number of incidents	Average number per month	Congestion averaged per day in incidents	Total number of days in month
August, 1940	143	322	4.6	4.6	60

No. 2431, Madras, 20th August 1914.

It is estimated that if all bamboos cut are stored under shelter after felling for six months and then floated dry, it will be possible to float twice as many bamboo in a raft than if they were green. The cost of rafting per 100 and per ton dry outturn would then be halved.

Locality and range	Total cost of rafting 100 bamboo to Chaliparampattu.		Total cost of rafting 100 bamboo to Beyapore.		Total cost of rafting 1 ton dry outturn to Chaliparampattu.		Total cost of rafting 1 ton dry outturn to Beyapore.	
	No. of days	No. of bamboo	No. of days	No. of bamboo	No. of days	No. of bamboo	No. of days	No. of bamboo
Nilgambur	20	4	20	4	10	2	10	2
Kannur	20	2	20	3	10	1	10	1

New Anamalaiyan, Nelli and Karumpoys.	20	1	20	12	6	10	6	10

*Cephalostachyum Pergracile*—In the case of the two clumps felled, data of felling, rafting, etc., were collected.

Three hundred and seventy-four clumps were felled and five half-bamboos or a total of 379 units by 19 cookies in one day, or 20 clumps per cooly per day.

No. 2431, Madras, 20th August 1914.

51

Range	Average cost of felling 100 bamboo to Chaliparampattu.		Average cost of felling 100 bamboo to Beyapore.		Average cost of felling 100 bamboo to Chaliparampattu.		Average cost of felling 100 bamboo to Beyapore.	
	No. of days	No. of bamboo	No. of days	No. of bamboo	No. of days	No. of bamboo	No. of days	No. of bamboo
Nilgambur	16	16	16	16	10	10	10	10
Kannur	21	0	16	0	10	0	10	0
Anamalaiyan, Karum and Marat.	11	0	16	0	10	0	10	0
New Anamalaiyan, Nelli and Karumpoys.	11	0	16	0	10	0	10	0

A 3 = five hundred and seven outturn dry weight is equivalent to one ton, so that the 100 tons of outturn per 100 million is approximately the cost of outturn of 1 ton dry outturn.

## Order—No. 2421, Revenue, dated 20th August 1914.

With its Forest Reference No. 85-GI/14-1, dated 20th January 1914, the

Forest No. 121.

for the establishment on the West Coast of a factory for the manufacture of paper pulp from bamboo. In furtherance of his scheme Mr. Nelson has asked for certain concessions, the more important of which are dealt with below.

2. Mr. Nelson requests that the Government should either themselves sell bamboos to his company at a low price, or grant, free of rent for five years and thereafter subject to rent, an extent of about 3,000 acres of land suitable for bamboo growth with an option on a further area for extension of bamboo plantations in the event of the enterprise proving a success. The Government cannot undertake to alienate to a private firm any considerable extent of land below its proper value, but they are prepared to consider an application for temporary revision of assessment on the analogy of the concessions specified in the notes to clause 15 of Board's Standing Order No. 20.

3. As to the quantity of the supply of bamboos desired, Mr. Nelson asks that the Government should deliver to the company 10,000 tons air dry in the first year and 20,000 tons annually thereafter until the company's plantations are in bearing. The Board has submitted with its own remarks and those of the Conservator of Forests, Western Circle, a careful detailed report prepared by Mr. Bourne on the possibility of working for bamboo certain natural forests in South Malabar. The Government are informed to agree with the Board to the view that the thinning of bamboo should benefit, rather than injure, the forests and for that reason they consider it unnecessary to stipulate that the company shall continue to buy bamboo from the Forest Department after the expiry of the proposed initial period of five years. As regards the rate at which bamboo should be sold to the company, the Government are prepared to supply at cost price for two years, but after that period they must stipulate for a profit of 12½ per cent. The cost price cannot be guaranteed but on the data available Mr. Nelson may be informed that it seems likely to work out to about Rs. 7-6-0 per ton.

4. With reference to his request for the grant of water rights to the company's factory free of charge, the Government consider that while water power may be given, if locally available, there should be a fair payment for the supply taken.

5. Mr. Nelson next asks that all the materials imported for constructing the company's mill and manufacturing the pulp should be exempted from import duty and that for a term of five years no export duty should be levied on bamboo pulp or paper. He should be informed that there is no export duty on paper pulp and that no concession in respect of import duty can be granted.

6. Mr. Nelson's last request is that bamboo pulp paper should be specified in Government contracts for paper. The Government can give no such promise until the price and the quality of the paper manufactured by the company are known. But Mr. Nelson may be assured of all reasonable official advice and assistance in the proposed enterprise.

7. The Board of Revenue will be requested to communicate to Mr. Nelson the substance of the foregoing remarks and to issue instructions to the Forest officers concerned to continue careful experiments and observation as to the reproductive power of bamboo, the cost of its production, etc.

(True Extract.)
