

## **Hematopathological observations in Kenyan children with sickle cell anemia in the first decade of life**

### **Abstract:**

This paper reviews clinicopathological and hematological manifestations of sickle cell anemia as seen in Kenyan children in the first decade of life. The information is based on a study of 447 patients. The findings are similar to those that are well documented from America, West Africa, and other parts of Africa. However, local variations and complications such as malnutrition and topical infections that may affect prognosis are high-lighted.
