

Abstract

Routine testing of 440 women (257 Fijians, 183 Indians) at the first antenatal attendance identified *Chlamydia trachomatis* in 50% of Fijians and 38% of Indians; the seropositivity rates for syphilis were 14.2% and 1.7% respectively, and the isolation rates for *N. gonorrhoeae* were 3.1% in Fijians and 1.1% in Indians.
