Abstract:

The pharmacokinetics of pindolol was studied in 8 normal Africans following administration of a single oral 10 mg dose. The mean peak concentration was 30.2 ± 5.0 ng X ml⁻¹, the mean half-life ($t_{1/2}$) of the elimination phase was 3.4 ± 1.1 h, and the total body clearance was 628 ± 13 ml X min⁻¹. The apparent volume of distribution was 3.0 ± 1.31 X kg⁻¹. The values are the same as those reported in Europeans.
