# THE EFFECT OF INTEREST RATES ON FINANCIAL PERFORMANCE OF COMMERCIAL BANKS IN KENYA

#### ISAAC MBURU NGURE

A RESEARCH PROJECT REPORT SUBMITTED IN PARTIAL FULFILMENT
OF THE REQUIREMENTS FOR THE AWARD OF THE DEGREE OF MASTER
OF BUSINESS ADMINISTRATION OF THE UNIVERSITY OF NAIROBI

# **DECLARATION**

This research project report is my original work and has not been presented to any other
institution for the award of a degree.
Signature: Date.
Isaac Mburu Ngure
D61/75837/2012
This research project report has been submitted for examination with my approval as the
University Supervisor.
Signature: Date:
Dr. Sifunjo Kisaka

# **DEDICATION**

This work is dedicated to my father for encouraging me with my studies. Without good formal education yet he never wavered in encouraging us to work hard. May God rest his soul in eternal peace.

# **ACKNOWLEDGEMENT**

I thank Almighty God for guiding me throughout my life for without Him I would not have come this far.

My special thanks go to my supervisor, Dr. Sifunjo Kisaka, for providing unlimited, invaluable and active guidance throughout the study. His immense command and knowledge of the subject matter enabled me to shape this research project to the product that it is now.

I also thank my family for letting me use their valuable time to work on this project. Finally, I owe my gratitude to a number of people who in one way or another contributed towards completion of this project especially my fellow colleagues at work and students.

#### **ABSTRACT**

Interest rates in Kenya have been fluctuating over the last few years with the effect of fluctuations remaining unknown on financial performance of commercial banks. Interest rates and macroeconomic volatility generally were the motivation behind this study as there was little information about effect of the same on commercial banks' financial performance in Kenya. In addition, commercial banks' profitability for most of the Sub-Sahara African countries has been about 2 percent over the last 10 years and compares significantly with other developing economies, but higher than the developed world. A major research question was why commercial banks in Sub-Sahara Africa remained more profitable irrespective of the high interest rates and volatile macroeconomic environment. This study sought to determine the effect of interest rates on financial performance of commercial banks in Kenya. The study used descriptive research design using secondary data obtained from Central Bank of Kenya for the period of five years from 2009 to 2013. Data obtained was analyzed using SPSS version 21 and results obtained tested for significance using ANOVA. The study found that interest rates have significant positive effect on financial performance of commercial banks in Kenya at 95% confidence level. The relationship between interest rates and financial performance was also found to be linear with increase in interest rates leading to higher profitability. The study also concluded that bank size and interest rate volatility had effect on profitability of commercial banks. The study also found that the model containing interest rates and size of commercial bank can explain 64% of the changes in commercial banks profitability. The study recommended that policies to be put in place to shield bank lending rates and ensure monitoring the same. Further, so as to cushion consumers from exploitation by commercial banks, the Central Bank need exercise their monitoring roles strictly and discipline any commercial banks that may be increasing the interest rates arbitrary to boost their profitability. The study also recommends that in times of poor performance of commercial banks and the need to boost their profitability may be necessary for their role in economy, Central Bank of Kenya should come up with monetary policy that will lead to rise in interest rates and hence improving banks profitability.

# **CHAPTER ONE**

#### INTRODUCTION

#### 1.1 Background of the Study

Commercial banks play a major role in the economy through their economic role of financial intermediation that performs both a brokerage and a risk transformation function (Hara, 1983). Commercial banks are financial intermediaries that mobilize savings from surplus economic units to deficit economic units. They are also special financial intermediaries that mobilize funds between depositors and borrowers participating in an economy. How well they perform this intermediary function has direct linkage with banks profitability and economic health of a nation. Profitability of banks has relationships with growth and development of an economy (Wainaina, 2013).

The banking industry has been facing numerous lending challenges. The explanation for this from a global context elicits varied reasons. Mulei (2003) points out that, this challenge arises because of paucity of skills required to determine the soundness of security valuation and the validity of legal charges associated with loan collateral while (Berger,1995) alleges that, the evolution of the banking industry has presented both challenges and opportunities for commercial banking institutions. Association of profitable organization is a dream of every individual, enterprise and government. Determinants of banks profitability in one continent are different from another continent (Yuqi, 2008).

The performance of commercial banks can be affected by internal and external factors which can be classified into bank specific (internal) and external factors. The internal factors are individual bank characteristics which affect the bank's performance, these factors are basically influenced by the internal decisions of management and board. The external factors are sector wide or country wide factors which are beyond the control of the company and affect the profitability of banks (Ongore, 2013). This study will focus on the effect of interest rates on the profitability of commercial banks in Kenya which are beyond the control of the banks. In order to survive in the long run, it is important for a bank to find out what are the determinants of profitability so that it can take initiatives to increase its profitability by managing the dominant determinants. Bank performance is also vitally important for all stake holders, such as the owners, the investors, the debtors, the creditors, depositors, bank managers, regulators and the government. The performance of banks gives directions to the stake holders in their decision making (Panayiotis, Athanasoglou, Delis and Staikouras, 2006).

#### 1.1.1 Interest Rates Background

Although it is difficult to prove the direction of the relationship between interest rates and profitability, interest rates instability generally has an effect with financial performance of commercial Banks. High interest rates will lead to increased commercial banks interest income but also lead to low demand for the loans and hence crowding out the increased interest income. Without interest rates stability, domestic and foreign investors will stay away and resources will be diverted elsewhere. In fact, econometric evidence of investment behavior indicates that in addition to conventional factors (past growth of economic activity, real interest rates, and private sector credit), private investment is

significantly and negatively influenced by uncertainty and macroeconomic instability (Sayedi, 2013). In addition to low (and sometimes even negative) growth rates, other aspects of macroeconomic instability can place a heavy burden on the commercial banks leading to reduced profitability (Gilchris, 2013).

Chen, Roll and Ross (1986) maintains that these macroeconomic factors are significant in explaining firm performance (profitability) and subsequent returns to investors. Simon (1997) found that exchange rate and current account have direct and positive relationship with inflation and both exchange rate and current account are the key factors that badly affect the small economies. Herrero (2003) points out that deteriorating local economic condition for instance low GDP, inflation, interest and exchange rate cause bank failure.

In conclusion, interest rate volatility is expected to affect financial performance of commercial banks whose role in an economy is the economic resource allocation where they channel funds from depositors to investors. Banks can only perform this vital role, if they generate necessary income to cover their operational cost they incur in the due course. Although it is difficult to prove the direction of the relationship between interest rates and profitability, studies confirm that interest rates instability has generally been associated with poor commercial banks financial performance in elastic loan markets since high interest rates reduces the demand for loans (Gilchris, 2013).

Interest rate is the price a borrower pays for the use of money they borrow from a lender/financial institutions or fee paid on borrowed assets. Interest can be thought of as "rent of money". Interest rates are fundamental to a capitalistic society and are normally

expressed as a percentage rate over the period of one year (Sayedi, 2013). Interest rate as a price of money reflects market information regarding expected change in the purchasing power of money or future inflation Interest rates are derived from macroeconomic factors which is the study of the behaviour of the economy as a whole such as total output, income, employment levels and the interrelationship among diverse economic sectors (Karl, Ray, and Shannon, 2009). These macro-economic factors include economic growth captured by gross domestic product (GDP), interest rates, exchange rates and inflation rates. Interest rates are worsened by regulations imposed on banks. The effect of macroeconomic factors in other sectors of the economy will always affect the banking sector and what goes on in the banking sector will affect the other sectors of the economy (Wainaina, 2013).

Inflation and inflationary expectations can press interest rate upward which affects lending terms resulting to reduced credit demand and lending ability of commercial banks (Keynes, 2006). Exchange rates affect interest rates and have an indirect impact on profitability through cost of loan able funds. High exchange rates leads to increased value commercial banks get from selling foreign currency that result to increased profitability. Studies have found positive relationship between exchange rate and bank loan loss. It may reflect how fluctuation and volatile exchange contribute to the debt profile of banks and reduce the profit level of borrowers (Owoeye, and Ogunmakin, 2013; Macharia, 2013). GDP is the measure of economic activity of a country. Increased economic activities increase the demand for loan able funds which in turn drives up the exchange rates. Decline in GDP result to reduced interest rates and fall in profitability of commercial banks and asset prices, leading to non-performing loans, lowers borrower's

financial capacity and depresses the value of collaterals as secondary means of servicing debts (Wainaina, 2013).

Commercial banks main role in an economy is the economic resource allocation. They channel funds from depositors to investors continuously. They can only perform this vital role, if they generate necessary income to cover their operational cost they incur in the due course. In other words for sustainable intermediation function, banks need to be profitable. Beyond the intermediation function, the financial performance of banks has critical implications for economic growth of countries. Good financial performance rewards the shareholders for their investment. This, in turn, encourages additional investment and brings about economic growth. On the other hand, poor banking performance can lead to banking failure and crisis which have negative repercussions on the economic growth (Panayiotis *et al.*, 2006).

#### 1.1.2 Financial Performance

Financial performance on the other hand is a measure of the change in financial state of an organization or the financial outcomes that results from management decisions and the execution of those decisions by members of the organization. Its outcomes are not universal in nature but largely depend on the organizational context hence selection of the measures that represent performance of a particular organization is done based upon the circumstances of the organization being rated. Financial performance is commonly measured by ratios such as return on equity, return on assets, return on capital, return on sales and operating margin (Gilchris, 2013).

Financial performance analysis of commercial banks has been of great interest to academic research since the Great Depression of 1940's. In the last two decades studies have shown that commercial banks in Sub-Saharan Africa are more profitable than the rest of the world with an average Return on Assets (ROA) of 2 percent. One of the major reasons behind high return in the region was investment in risky ventures. The other possible reason for the high profitability in commercial banking business in sub-Saharan Africa is the existence of huge gap between the demand for bank service and the supply thereof. That means, in Sub-Sahara Africa the number of banks are few compared to the demand for the services; as a result there is less competition and banks charge high interest rates. This is especially true in East Africa where the few government owned banks take the lion's share of the market (Flamini et al., 2009).

The performance of commercial banks can be affected by internal and external factors (Al-Tamimi, 2010; Aburime, 2005). These factors can be classified into bank specific (internal) and macroeconomic variables. The internal factors are individual bank characteristics which affect the bank's performance. These factors are basically influenced by the internal decisions of management and board. The external factors are sector wide or country wide factors which are beyond the control of the company and affect the profitability of banks. Studies show that performance of firms can also be influenced by ownership identity (Ongore, 2011).

The banking sector is the single sector highly affected by key macroeconomic variables which include interest rates, inflation and Economic growth measured by GDP and therefore, their financial performance will mostly depend on macroeconomic stability. Macroeconomic stability is the cornerstone of any successful effort to increase private

sector development and economic growth. Cross-country regressions using a large sample of countries suggest that growth, investment, and productivity are positively correlated with macroeconomic stability (Easterly, Islam, and Stiglitz, 1999).

#### 1.1.3 Contextual Background

Kenya has been characterised by interest rate volatility in the last five years whose effect on commercial banks remains unknown. The instability on macroeconomic variables was witnessed in year 2011 where interest rates rose to over 30%, inflation rate to 13.97 percent compared to 3.9 percent in 2010 and Kenya shilling greatly weakened against major world currencies. Against the US dollar, the shilling averaged 101.270 in October 2011 from 81.029 in January 2011. In order to increase their profitability, commercial banks in Kenya started to diversify their revenue streams (Macharia, 2013).

Kenya has been characterized with volatile interest rates in the recent past whose effect on commercial banks performance remains unknown. However, commercial banks profitability in sub Saharan Africa has remained high compared to the rest of the world. Kenya has of late initiated a framework and infrastructure to encourage lending through public and private credit reference bureaus, institutional strategies to spur economic development such as the vision 2030 in Kenya and financial systems approaches which include alternatives to collaterals in order to access credit.

Commercial banks are custodians of depositor's funds and operate by receiving cash deposits from the general public and loaning them out to the needy at statutorily allowed interest rates. Commercial banks in Kenya dominate the financial sector. In a country where the financial sector is dominated by commercial banks, any failure in the sector

has an immense implication on the economic growth of the country. This is due to the fact that any bankruptcy that could happen in the sector has a contagion effect that can lead to bank runs, crises and bring overall financial crisis and economic tribulations (IMF, 2001).

Commercial banks in Kenya have been performing very well in terms of profitability. Despite the good overall financial performance of banks in Kenya, there are a couple of banks declaring losses. The current banking failures in the developed countries and the bailouts thereof call for Kenya authorities to take precautionary and mitigating measures, there is dire need to understand the performance of banks and how the macroeconomic variables have been affecting banks profitability. According to Central Bank of Kenya (2011) Supervision Report as of December 2011 out of the 43 commercial banks 30 of them are domestically owned and 13 are foreign owned. In terms of asset holding, foreign banks account for about 35% of the banking assets (CBK, 2011).

The banking sector is one of the key industries in Kenyan economy just like in any other country and is highly affected by macroeconomic variables than any other industry. To ensure that the industry remains profitable and hence to be able to achieve its role in economic development, the sector has experienced major transformation in its operating environment. In a number of countries, financial sector reforms have been implemented. In these reforms, the role of commercial banks has remained central in financing economic activities in the various segments of the markets especially in Sub-Saharan Africa.

In recent years, a growing number of developing countries including Kenya have embarked on reforming and deregulating their financial systems, transforming their institutions into effective intermediaries and extending viable financial services on a sustainable basis to all segments of the population (Seibel, 2001). In the process, a new world of finance has emerged which is demand-led and savings driven and conforms to sound criteria of effective financial intermediation (Miller, 2003). Panayiotis *et al.* (2006) showed that both external as well as domestic factors have contributed to growth in performance of commercial banks in the last two decades. The studies conducted suggest that, given the importance of commercial banks in Africa, better understanding of the determinants of their performance is important.

#### 1.2 Research Problem

Interest rate volatility has negative impact on the financial performance of commercial banks posing challenge to commercial banks managers in their core function of credit management and profitability (Baum, Mustafa, and Neslihan, 2009). The volatility on interest rates is blamed on poor mmacroeconomic policies which include excessive government spending, high inflation, and overvalued exchange rates. Distortional macroeconomic policies are at times intentional since politicians believe that high interest, inflation and overvalued exchange rates are good for economic performance. In fact, when formulating macro economic variables, the effect of the policies on commercial banks performance is usually not a consideration (Williamson, 1990).

Interest rates in Kenya have been fluctuating over the last few years with the effect of fluctuations remaining unknown (Otuori, 2013). The latest interest rates volatility was the

motivation behind this study as there was little information about effect of same on commercial banks' financial performance in Kenya. In addition, there is insufficient empirical evidence that commercial banks financial performance is hindered by interest rates volatility and poor macroeconomic variables at large. In addition, commercial banks' profitability for most of the Sub-Sahara African countries has been about 2 percent over the last 10 years which is higher than that of commercial banks in developed countries (Al-Tamimi and Hassan, 2010). A major research question is why commercial banks profitability has remained high irrespective of the unfavourable interest rates environment.

The need for this study is further supported by the fact that most studies conducted in relation to bank performances in Kenya has focused on sector-specific factors that affect the overall banking sector performances or determinant of bank performance with no study focusing on interest rates and commercial banks financial performance. Macharia (2013) studied the effects of global financial crisis on the financial performance of commercial banks offering mortgage finance in Kenya where interest rates and inflation were found to have negative effect on performance while positive effect with exchange rates. Wainaina (2013) studied the effect of macroeconomic factors on commercial banks lending to agricultural sector in Kenya and found that increase in interest rate affected the amount of credit provided by the commercial banks. Mboka (2013) studied the effects of macroeconomic variables on nonperforming loans of commercial banks in Kenya and found a strong correlation between interest rates and bank profitability.

None of these studies had examined the effect of interest rates on commercial banks financial performance yet interest rates have been very volatile. Thus, this study sought to determine the effect of interest rates on banks' financial performance and hence bridge the knowledge gap that existed in literature. It answered the question, what is the effect of interest rates on financial performance of commercial banks?

#### 1.3 Objective of the Study

To determine the effect of interest rates on financial performance of commercial banks in Kenya

# 1.4 Value of the Study

Empirical evidence clearly shows that studies focusing on Kenya's financial sector are still scanty and limited. Even those which have been carried out point to a need for further investigation of the factors which have continued to cause poor financial performance in the country, notwithstanding the reforms. Most of the evidence in regard to commercial banks' performance largely focus on the developed economies environments and the conclusions may not be useful for Kenya's financial sector planning. Therefore the study will be important to various stakeholders with interest in Kenya's economy including the government, citizens, the banks, foreign investors and academicians.

To the government and macroeconomic policy makers, the study is significant to them since they will understand the relationship between the effects of interest rates on bank performances. They will have more knowledge and hence come up with better policies to

ensure banks financial performance is restored so as to boost economic growth. The Kenyan citizens will benefit from the implementation of the study findings and due to improved access to financial services and favorable interest rates environment. This will lead to improved lifestyles, high employment and increased households' incomes. To the banks and foreign investors, they will be able to plan and determine the most appropriate time to make investments in financial sector based on interest rates prevailing. To academicians, the study has added to the existing body of knowledge on bank performance and form a basis for further research.

# **CHAPTER TWO**

#### LITERATURE REVIEW

#### 2.1 Introduction

This chapter focuses on theoretical, empirical literature, review of the local literature and ends by a chapter summary. The chapter starts by section 2.2 that has discussed theoretical literature, followed by section 2.3 that contains the empirical literature on macroeconomic variables and commercial banks performance.

#### 2.2 Theoretical Review

Various theories have been discussed presenting arguments that guided this study. These theories include Schumpeter economic cycle theory, Keynesian liquidity preference theory and macroeconomic theory.

#### 2.2.1 Schumpeter Economic Cycle Theory

The theory was propounded by Schumpeter (1939) who indicated the process of economic change or evolution that consists of two distinct phases, "prosperity" and "recession". One under which the impulse of entrepreneurial activity, draws away from an equilibrium position, and the second of which it draws toward another equilibrium position. Schumpeter calls those fluctuations/cyclical processes in economic life business cycle. Schumpeter shows the intermediary role of financial sector between those who save and invest, through a process referred to as credit creation by bank financing that

leads to economic growth and development. The effect of this process leads to profit and loss generation by the lender and the borrower.

Certain macroeconomic variables typically display unique pattern of boom and recession in a business cycle. A crisis is said to occur at the peak of expansion when growth in real GDP and domestic demand decline leading to acceleration in inflation. During periods of economic expansion, firms and their respective sectors profits increases, asset prices rises aggregate sectoral demand for credit facilities expands leading to growth in bank lending resulting to increased interest income. Banks may underestimate their risk exposures, relaxing credit standards and reduce provisions for future losses while the economy indebtedness rises. As the downturn sets in individual's, firms and sector profitability deteriorates (Bikker and Hu, 2002).

The theory assumes that recessions and periods of economic growth are efficient response to exogenous changes in the real economic environment and that decline in profitability result in fall of asset prices, non-performing loans, lowers borrowers' financial capacity, fall in employment levels, and depresses the value of collaterals as secondary means of servicing debts. Banks' risk exposure increases, and consequently raises the need for larger loan provisions and higher levels of capital, exactly when it is more expensive or simply not available. This may lead to banks reacting by reducing the amount of lending, especially if they have low capital buffers above the minimum capital requirement, thus increasing the effects of the economic downturn as well as increasing the lending rates.

Critics of the theory states that it is a common misconception that macroeconomic purely based on shocks to supply, as opposed to shocks on demand, and this leads to the common criticism of Schumpeter economic cycle theory by ignoring the demand side of the economy. However, in real business cycles situation, consumers will change their intertemporal consumption and savings decisions based on the real interest rate available to them, which is a shift in demand.

In relation to the study, the theory views interest rates changes as normal economic occurrences which will affect commercial banks performance. It disregards the argument that interest rates are determined by the liquidity in the economy but are determined by the prevailing macroeconomic environment as determined by the business cycles. Hence, according to the theory, interest rates will keep on changing according to the prevailing macro-economic conditions.

# 2.2.2 Keynes's Liquidity Preference Theory

The theory was advanced by Keynes (2006). According to the liquidity preference theory, the interest rates are determined by the demand for and supply of money balances. The theory assumes that people's demand for money is not for transactions purpose but as a precaution and for speculative purposes. The transaction demand and precautionary demand for money increase with income, while the speculative demand is inversely related to interest rates because of the forgone interest. The supply of money is determined by the monetary authority (the central bank), by the lending of commercial banks and by the public preference for holding cash (Were, Kamau, Sichei, Kiptui, 2013).

Therefore, interest rates are expected to increase as the maturity profile of securities increases. This is so because the longer the maturity, the greater is the uncertainty; and therefore the premium demanded by investors to part with cash increases as the maturity profile increases. The expectation, therefore, is that forward exchange rates should offer a premium over expected future spot exchange rates since those who are risk-averse demand a premium for securities with longer-term maturities. A premium is offered by way of greater forward rates in order to attract investors to longer-term securities. Consequently, current interest rates reflect expected inflation rates, income (GDP) and expected money supply changes (Were *et al.*, 2013).

Critics of this theory argue that the liquidity preference theory of interest suffers from a fallacy of mutual determination. Keynes alleges that the rate of interest is determined by liquidity preference. In practice, however, Keynes treats the rate of interest as determining liquidity preference. The critics state that "The Keynesians therefore treat the rate of interest, not as they believe they do- as determined by liquidity preference- but rather as some sort of mysterious and unexplained force imposing itself on the other elements of the economic system (Were *et al.*, 2013).

In relevance to the study, the theory views interest rates as being mainly driven by the liquidity level in the economy. The theory does not recognize the role of macroeconomic policies formulated by the central bank but interest rates are purely driven by the demand of money in the economy. Therefore, interest rates will go up and down according to the level of liquidity in the economy and preference for the liquidity by the users of funds.

#### 2.2.3 Macroeconomic Theory

The theory was proposed by Friedman, (1963). The theory views interest rates as always and everywhere a monetary phenomenon (Friedman, 1963). Further, macroeconomic theory assumes that growing the money supply in excess of real growth causes interest rates to rise. This is also the result from the Harberger (1963) model, which assumes that prices adjust to excess money supply in the money market. It is on the basis of this assumption that it is possible to invert the real money demand and control interest rates. Interest rates volatility in open economies results from different disequilibria in many markets specifically, the domestic money market, external/foreign markets and the labour market. Thus increase in interest rates emanates from three main sources that include excess money supply, foreign prices and cost push factors (Were et al., 2013). The theory is related to keysian liquidity preference theory but recognizes additional sources of interest rates not only demand for money but also foreign prices and cost push factors.

Critics of this theory base their argument on the grounds that governments would in practice be unlikely to implement theoretically optimal policies. According to them, the implicit assumption underlying the macroeconomic revolution was that economic policy would be made by wise men, acting without regard to political pressures or opportunities, and guided by disinterested economic technocrats. They argued that this was an unrealistic assumption about political, bureaucratic and electoral behaviour.

In relevance to the study, macroeconomic theory views growing money supply in excess of real growth as the cause of interest rates to rise. Interest rate volatility is seen by the theory as emanating from three main sources that include excess money supply, foreign prices and cost push factors. Interest rates volatility will also results from different dis-

equilibria in many markets specifically, the domestic money market, external/foreign markets and the labour market. Hence controlling interest rates volatility will involve dealing with disequilibrium in the markets.

# 2.3 Determinants of Commercial Banks Profitability

Determinants of bank profitability can be internal or external. Internal determinants of banks financial performance normally consist of factors that are within the control of commercial banks. They are the factors which affect the revenue and the cost of the banks. Some studies classified them into two categories namely the financial statement variables and non-financial variables. External factors are said to be the factors that are beyond the control of the management of commercial banks. The external determinants of commercial banks profitability are indirect factors, which are uncontrollable, but have an enormous impact on bank's profitability.

#### 2.3.1 Interest Rates

Interest rates instability generally has been associated with poor financial performance of commercial Banks. Without interest rates stability, domestic and foreign investors will stay away and resources will be diverted elsewhere. In fact, econometric evidence of investment behavior indicates that in addition to conventional factors (past growth of economic activity, real interest rates, and private sector credit), private investment is significantly and negatively influenced by uncertainty and macroeconomic instability (Sayedi, 2013). Although it is difficult to prove the direction of the relationship between interest rates and profitability, studies confirm that interest rates instability affects

commercial banks financial performance with studies giving contradicting findings (Gilchris, 2013).

### 2.3.2 Deposits

Banks are said to be heavily dependent on the funds mainly provided by the public as deposits to finance the loans being offered to the customers. There is a general notion that deposits are the cheapest sources of funds for banks and so to this extent deposits have positive impact on banks profitability if the demand for bank loans is very high. That is, the more deposits commercial bank is able to accumulate the greater is its capacity to offer more loans and make profits. However, one should be aware that if demands for banks loans are low, having more deposits could decrease earnings and may result in low profit for the banks. This is because deposits like Fixed, Time or Term deposits attract high interest from the banks to the depositors (Buyinza, 2010).

#### 2.3.3 Bank Size

Bank size affects the firm's market share which affects profitability. The bigger the firms market share, the more the sales; so in the case commercial banks are able for example to offer more loans then they stand a greater chance of increasing interest income as well as profits. Market share or size of banks is normally used to capture potential economies or diseconomies of scale in the banking sector. Secondly, the size of banks as a variable control for cost differences and product and risk diversification (Rachdi, 2013).

# 2.4 Empirical Literature

Studies on the effect of interest rates on commercial banks profitability are numerous with most of them studying macroeconomic variables relationship with profitability. This section has reviewed some of the studies, their methodology and findings.

#### 2.4.1 International Empirical Literature

Yuqi (2008) examined the determinants of 123 United Kingdom (UK) banks profitability and its implication on risk management from 1999 to 2006. The study utilized multiple regression models and panel data estimation. The econometric results indicate that capital adequacy has significant positive impacts on profitability but inflation has insignificant positive impact on profitability. Liquidity and credit risk had significant negative impacts on profitability though; GDP and interest rate have insignificant negative impacts on the profitability of banks in UK. Buyinza (2010) investigated samples of 23 commercial banks profitability from 1999 to 2006 in Sub Sahara Africa countries. The study utilized panel data and the regression results revealed that capital, efficient expenses management, bank size, credit risk, diversified earning ability of the banks, per capital GDP, growth rate and inflation have significant and positive impact on banks' profitability.

Ali, Akhtar, and Ahmed (2011) examined the bank specific and macroeconomic indicators of 22 public and private sector commercial banks profitability from 2006 to 2009 in Pakistan. The research made use of multiple regression models and panel data estimation. The study found that bank size, operating efficiency, asset management and GDP had positive effect on banks' profitability. However, capital and credit risk had negative effect on banks profitability in Pakistan.

Gul, Irshad, and Zaman (2011) studied the factors affecting samples of 15 commercial banks profitability from 2005 to 2009 in Pakistan. The investigation utilized a regression model, panel data estimation and Pooled Ordinary Least Square (POLS) method of computation with the aid of an econometric package. The econometric result indicated both internal and external factors such as bank size, loan, deposit, GDP, inflation and market capitalization have significant positive influence on banks profitability measured by Return on Assets (ROA). Still in Pakistan, Gilchris (2013) examined the influence of bank specific and macroeconomic factors on samples of 25 commercial banks profitability from 2007 to 2011 in Pakistan. The regression results indicated that bank size, net interest margin, and industry production growth rate had positive and significant impact on the profitability (ROA and ROE). Non- performing loan to total advances and inflation have negative and significant impact on ROA while GDP has positive impact on ROA. Capital ratio has positive significant impact on ROE.

Saidu and Tumin (2011) investigated the performance and financial ratios on samples of four Malaysian and nine Chinese commercial banks from 2001 to 2007. The research made use of panel data and the regression results show that credit, capital and operating ratios have influence on the performance of banks in China which is not true for Malaysia. The study found that liquidity and size of the banks do not influence the performance of the banks in both countries.

Khrawish, and Siam, (2011) investigated the determinants on samples of three Jordan Islamic banks profitability from 2005 and 2009. The multiple linear regression results show capital, bank size, financial risk, GDP growth rate, inflation, and exchange rate

have significant negative relationship with profitability but credit risk has insignificant positive relationship with the profitability of Islamic banks in Jordan.

Rachdi (2013) examined what determines the profitability of banks during and before the international financial crisis. The study samples 10 Tunisian banks from 2000 to 2010. The regression results indicate that, before the US subprime crisis, capital adequacy, liquidity, bank size and yearly real GDP growth affect positively the performance (ROA, ROE and NIM) of Banks. However, cost-income ratio, yearly growth of deposits and inflation rate are negatively correlated across all measures of bank profitability. In crisis period, bank profitability is mainly explained by operational efficiency, yearly growth of deposits, GDP growth and inflation.

# 2.4.2 Local Empirical Literature

Lucas and Anne (2010) examined the effect of macroeconomic developments on performance, credit quality and lending behaviour of banks in Kenya, by estimating a dynamic panel data model using Generalized Method of Moments. The study suggested that banks needed to continue pursuing risk sensitive loan pricing policies to ease the extent of countercyclical behaviour during economic upswings/downswings respectively, which in turn reduces the chances of supply driven credit crunch effects.

Macharia, (2013) studied the effects of global financial crisis on the financial performance of commercial banks offering mortgage finance in Kenya. The study found a negative relationship between inflation, interest rates as a result of global financial crisis and financial performance of commercial banks offering mortgage finance in Kenya. A unit increase in inflation and interest rates led to a 0.543 and 0.425 decrease

respectively in the scores of financial performance of commercial banks offering mortgage finance in Kenya. The study further found that exchange rates as a result of global financial crisis had positive effect on financial performance of commercial banks offering mortgage finance in Kenya. A unit increase in foreign exchange rates led to a 0.652 increase in the scores of financial performance of commercial banks offering mortgage finance in Kenya.

Otuori (2013) investigated the determinant factors of exchange rates and their effects on the performance of commercial banks in Kenya. The study found that exports and imports Interest rates, inflation and exchange rates were all highly correlated. By manipulating interest rates, central banks could exert influence over both inflation and exchange rates, and changing interest rates impact inflation and currency values. Higher interest rates offered lenders in an economy a higher return relative to other countries which attract foreign capital and cause the exchange rate to rise.

Mboka (2013) studied the relationship between macro-economic variables on nonperforming loans of commercial banks in Kenya. Data was analyzed by applying both descriptive and inferential statistics for a 10 year period (2003 to 2012). The study found a strong correlation between inflation and gross domestic product and current account deficit. GDP also correlated strongly with inflation and Money supply. A significant and positive correlation was also found between nonperforming loans and GDP growth rate, exchange rate volatility, and banking sector development index. Kiruri and Olkalou (2013) studied ownership structure on samples of 43 banks profitability from 2007 to 2011 in Kenya. The simple linear regression shows that ownership concentration and state ownership had negative and significant effects on bank profitability while foreign

ownership and domestic ownership had positive and significant effects on bank profitability in Kenya.

# 2.5 Summary

Most studies conducted in relation to bank performances have focused on sector-specific factors that affect the overall banking sector performances or determinant of bank performance with no study focusing on interest rates and commercial banks financial performance. None of these studies have examined the effect of interest rates on commercial banks financial performance, yet interest rates have been very volatile of late and there is the need to determine how they affect commercial banks performance.

The empirical review above indicates that macroeconomics indicators are critical factors that determined the performance of commercial banks in their financial intermediary role of lending. Most studies on this subject were done in different regions, on different macroeconomic indicators and sectors with scanty studies done in developing countries and particularly in Kenya specifically on interest rates. There is therefore a gap in literature regarding the effect of interest rates on commercial banks performance in Kenya. This study seeks to bridge this gap.

# **CHAPTER THREE**

#### RESEARCH METHODOLOGY

#### 3.1 Introduction

The chapter outlines the research design and methodology that was applied in conducting this study. It describes the research design, population of the study, sample size, sample frame, data collection methods and data analysis and presentation of the research findings. The chapter has section 3.2 which covers the research design, section 3.3 on the target population and sample frame, section 3.4 on data collection methodology and instruments and section 3.5 covering the data analysis techniques applied, the conceptual and analytical model.

#### 3.2 Research Design

The research employed descriptive research design. Descriptive research design method helps in gathering information about the existing status of the phenomena in order to describe what exists in respect to variables. This method is used because it addresses the objective of the study in investigating the relationship between the variables of the study (Kothari, 2008). The design takes into consideration aspects like the size of sample in relation to the target population, the variables under the study, the approaches to the research, and the methods employed in data collection.

Correlation method was used to determine the relationship between interest rates and profitability of commercial banks. The study used time series empirical data on the

variables to examine the relationship between interest rate by establishing correlation coefficients between the variables and profitability of commercial banks measured by ROA.

# 3.3 Population of the Study

A population is defined as an entire group of individual or objects having common observable characteristic. It refers to the entire group of people, items or things of interest that the researcher wishes to investigate and from which the sample will be drawn and studied. It is generally a large collection of individuals or objects that is the main focus of a scientific query. It is for the benefit of the population that researches are done. However, due to the large sizes of populations, researchers often cannot test every individual in the population because it is too expensive and time-consuming (Mugenda & Mugenda, 2008).

The target population for this study was all commercial banks in Kenya. There were 44 commercial banks in Kenya as at August 26<sup>th</sup> 2014. The 44 commercial banks will constitute the study population (Central Bank of Kenya, 2014). According to Central Bank of Kenya 31 are locally owned while 13 are foreign owned (See appendix I). All the 44 commercial banks will be targeted in this study.

## 3.4 Sample and Sampling Techniques

The sampling frame describes the list of all population units from which the sample is selected (Cooper & Schindler, 2008). It is a physical representation of the target

population and comprises all the units that are potential members of a sample (Kothari, 2008). All the 44 banks constituted the study sample.

A census design was applied where all the 44 commercial banks were studied. A census is a collection of information from all units in the population or a complete enumeration of the population. A census design is used where the population is small and manageable (Mugenda & Mugenda, 2003).

#### 3.5 Data Collection

Data collection refers to the means by which information is obtained from the selected subjects of an investigation or a study. It refers to the techniques applied in extracting the required study data for analysis (Mugenda & Mugenda, 2008). The data required for the study was obtained from secondary sources that were used to investigate the relationship between dependent and independent variables. In the study, five years data (2009 to 2013) was collected.

The secondary data sources included various like Central Bank of Kenya, Kenya National Bureau of Statistics, World Bank websites and commercial banks financial statements. The collected data related to dependent variable which is the commercial banks profitability as measured by return on assets and the independent variables which included Interest rate and size of commercial banks.

## 3.6 Data Analysis

Data analysis is the process of inspecting, cleaning, transforming, and modelling data with the goal of discovering useful information, suggesting conclusions, and supporting decision making. Data analysis has multiple facets and approaches, encompassing diverse techniques under a variety of names, in different business, science, and social science domains (Kothari, 2008). The study used quantitative method to determine the relationship from the data obtained. This model of analysis examined the simultaneous effects of the independent variables on a dependent variable.

A descriptive analysis technique was employed to analyse data. This included the use of table, charts, graphs, percentages and frequencies (Mugenda & Mugenda, 2008). Multiple regressions were used to determine the relationship between profitability and various interest rates using the Statistical Package for Social Sciences (SPSS) version 21.

## 3.6.1 Conceptual Model

The following function shows the mathematical relationship between the dependant and independent variable.

$$ROA=f(INT, Size)$$
 (1)

Where:

ROA = Return on Assets which is a measure of commercial bank financial performance

INT = Interest rates measured as the average commercial banks lending interest rate provided by CBK

Size = Size of commercial banks as measured by asset base

# 3.6.2 Analytical Model

This study employed an empirical model to determine the relative significance of each of the variables identified above. The model took the following format;

$$ROA = \beta_0 + \beta_1 INT + \beta_2 Size + \varepsilon$$
 (2)

Where:

 $\varepsilon$  = Represents the error in the model which was assured to be zero

 $\beta$ 1,  $\beta$ 2 are the coefficient of the explanatory variables

The analysis of variance (ANOVA) was used to test the significance of the overall model at 95% level of significance. Coefficient of correlation (R) was used to determine the strength of the relationship between the dependent and independent variables. Coefficient of determination (R<sup>2</sup>) was also be used to show the percentage for which each independent variable and all independent variables combined were explaining the change in the dependent variable.

## 3.7 Data Validity and Reliability

Reliability is the consistency of a set of measurement items while validity indicates that the instrument is testing what it should. Reliability is the consistency of the measurement, or the degree to which an instrument measures the same way each time it is used under the same condition with the same subjects. It is the probability of your measurement. A measure is considered reliable if a person's score on the same test given twice is similar. Reliability is not measured but it is estimated and does not, however, imply validity because while a scale may be measuring something consistently, it may not necessarily be what it is supposed to be measuring. To ensure that data validity and reliability, data analyzed was obtained from Central Bank of Kenya publications.

## **CHAPTER FOUR**

# DATA ANALYSIS, RESULTS AND INTERPRETATIONS

## 4.1 Introduction

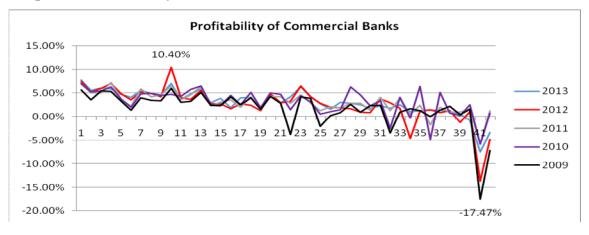

This chapter presents the data analysis, interpretation and discussion of the research findings. The collected data was analyzed and interpreted in line with the objective of the study which was to determine the effect of interest rates on financial performance of commercial banks in Kenya. The chapter is divided into section 4.2 on summary of statistics, section 4.3 on estimated model, section 4.4 on discussion and section 4.5 on summary.

# 4.2 Summary of Statistics

Both descriptive and inferential statistics were employed specifically using regression and ANOVA to establish the significance /fitness of the model and also to establish the link between financial performances with interest rate.

#### 4.2.1 Profitability of Commercial Banks in Kenya

**Graph 4.1: Trend Analysis of Commercial Bank Performance** 

As shown in graph 4.1 above, most commercial banks have positive return on assets implying that Kenyan commercial banks are profitable. The highest performance was recorded in year 2012 where the best performing commercial bank had a return on assets of 10.4%. The lowest performance was found to be in year 2009 whereby the highest loss made by worst performing commercial bank was -17.47%.

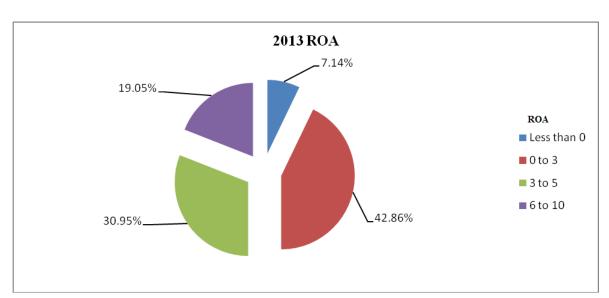

Figure 4.1: Year 2013 Commercial Banks Profitability

**Source: Research Findings** 

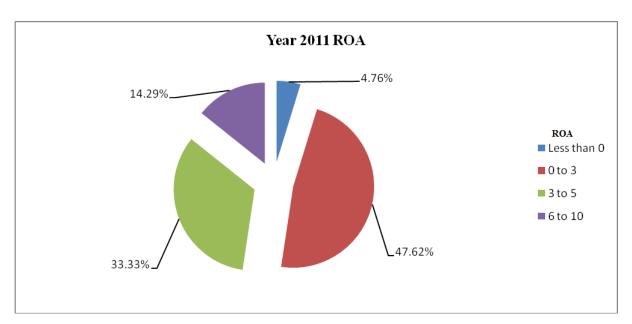

As shown in figure 4.1 above, in year 2013, 42.86% of commercial banks had ROA of between 0% and 3%, 30.95% had ROA of between 3% and 5%, 19.05% had ROA of 6-10%, while 7.14% had a negative ROA.

19.05% ROA Less than 0 0 to 3 3 to 5 6 to 10

Figure 4.2: Year 2012 Commercial Banks Profitability

**Source: Research Findings** 

As shown in figure 4.2 above, in 2012, 47.62% of the banks had ROA of 0-3%, 23.81% with a ROA of 3 to 5%, 19.05%, between 6 to 10% and 9.52% negative ROA.

**Figure 4.3: Year 2011 Commercial Banks Profitability** 

Commercial banks profitability in 2011 is shown in figure 4.3 above. As shown in figure 4.3 below, in year 2011, 47.62% of commercial banks had ROA of between 0% and 3%, 33.33% had ROA of between 3% and 5%, 14.29% had ROA of 6-10%, while 4.176% had a negative ROA.

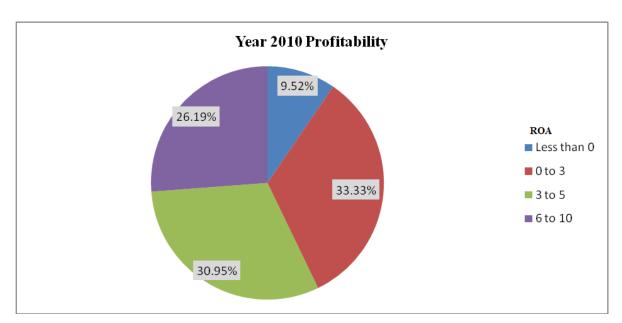

Figure 4.4: Year 2010 Commercial Banks Profitability

**Source: Research Findings** 

As shown in figure 4.4 above, in 2010, 33.33% of the banks had ROA of 0-3%, 30.95% with a ROA of 3 to 5%, 26.19%, between 6 to 10% and 9.52% negative ROA.

Year 2009 Profitability

11.90%

ROA

Less than 0

0 to 3

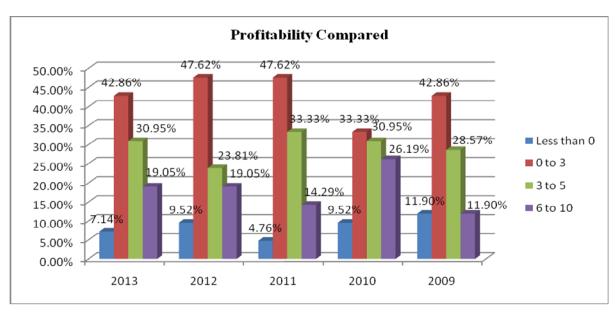

3 to 5

6 to 10

Figure 4.4: Year 2009 Commercial Banks Profitability

**Source: Research Findings** 

As shown in figure 4.4 above, in year 2009, 42.86% of commercial banks had ROA of between 0% and 3%, 28.57% had ROA of between 3% and 5%, 11.90% had ROA of 6-10%, while 1.9% had a negative ROA.

**Graph 4.2: Comparative Bank Profitability for Year 2009 to 2013** 

As shown in graph 4.2 above, commercial banks profitability improved between year 2009 to 2011 with the number of commercial banks having negative ROA reduce from 11.9% to 9.5% to 4.76% in years 2009, 2010 and 2011 respectively. The performance deteriorated between year 2011 and 2012 with the number of commercial banks with negative ROA increasing from 4.76% in 2011 to 9.52% in 2012. However, the performance of commercial banks improved in year 2013 with the number of commercial banks with negative ROA reducing 7.14% from 9.52%. Almost 50% of commercial banks have ROA of 0% to 3% with around 30% of the banks having ROA of 3% to 5%. This implies that over 80% of Kenyan commercial banks have ROA of 0% to 5%.

The number of commercial banks with ROA of above 5% was found to move from 11.9% in 2009, to 26.19% in 2010, to 14.29% in 2011, to 19.05% in 2012 and 19.05% n 2013. This indicates the volatile market condition between year 2009 and 2010, 2010 and 2012.

#### 4.2.2 Trend Analysis on Commercial Banks Lending Interest Rate

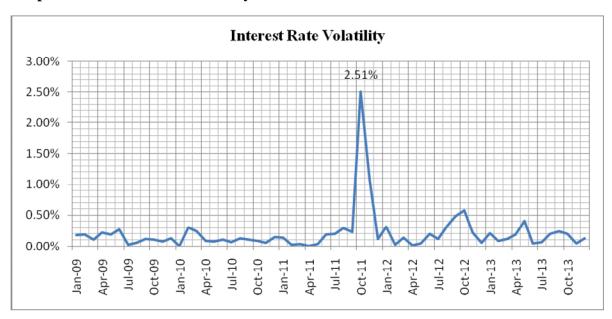

**Graph 4.3: Interest Rates Movements** 

As shown in graph 4.3 above, commercial banks interest rates in Kenya remained stable from January 2009 to October 2012 after which they significantly rose from 14.72% to 20.12% in December 2011, a level that was maintained up to July 2012 after which interest rates declined to 17.97%. Thereafter, the interest rates have remained stable at 16% and 17%.

# **4.2.3** Interest Rate Volatility

**Graph 4.4: Interest Rates Volatility** 

**Source: Research Findings** 

Interest rate volatility was measured by standard deviation. As shown in graph 4.4 above, interest rates volatility remained below 0.5% but rose to 2.51% in October 2011. From 2012, interest rates remained volatile reaching to 0.6%.

# 4.2.4 Average Annual Interest Rates

**Table 4.1: Annual Interest Rates** 

Year	Mean Annual Interest Rates	Standard Deviation
2009	14.37%	0.18%
2010	14.18%	0.32%
2011	14.97%	2.11%
2012	19.75%	0.85%
2013	17.23%	0.49%

Source: Research Findings

The average annual interest rates for year 2009 to 2013 are shown in table 4.1 above. As shown in the table, commercial banks' lending rates remained relatively stable in years 2009, 2010 and 2011 but rose from 14.97% in 2011 to 19.75% in 2012, but declined to 17.23% in 2013

# 4.2.5 Commercial Banks Industry Returns

**Table 4.2: Commercial Banks Industry Returns** 

Year	Mean Annual Interest Rates	Standard Deviation
2009	1.64%	0.0398
2010	3.02%	0.0285
2011	2.96%	0.0233
2012	2.54%	0.0377
2013	3.01%	0.0272

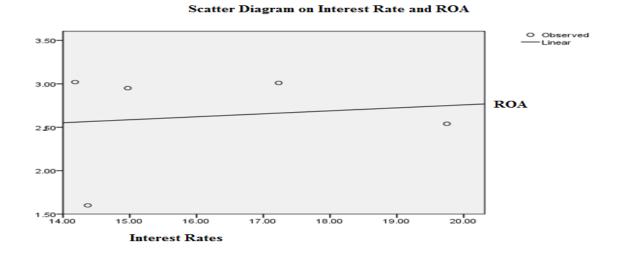

As shown in table 4.2 above, commercial banks industry in Kenya has positive returns exceeding the 2% globally taken to be appropriate for commercial banks except for year 2009. The industry profitability improved in 2010 from 1.64% in 2009 to 3.02 in 2010, reduced to 2.96% in 2011, 2.54% in 2012, and 3.01% in 2013. As shown by the standard deviation values below, commercial banks industry profitability has been stable irrespective of the volatility in interest rates.

#### 4.3 Effect of Interest Rates on Financial Performance

To develop the variables for analytical model discussed in topic three, SPSS was used by applying multiple linear regression technique.

# 4.3.1 Results of Correlation Analysis

Graph 4.5: Scatter Diagram between Interest Rates and Profitability

Source: Research Findings

The relationship between interest rates and ROA was observed to be liner and positive as shown in graph 4.5 above.

**Table 4.3: Correlation Results on Financial Performance** 

Model Summary	Pearson	R Square	Adjusted R	Sig. (2-
	Correlation		Square	tailed)
Interest Rate Volatility	0.30102	0.09061	0.21252	0.00623
Interest Rates	0.5746	0.3302	0.3126	0.0084
Asset Base	0.46969	0.22061	0.20113	0.0017

**Source: Research Findings** 

As shown in table 4.3 above, the relationship between interest rate volatility is positive with coefficient of correlation of 0.3 and coefficient of determination of 0.09. The relationship is also significant p value of 0.006 is less than 5%. The relationship between interest rates and financial performance is positive with a coefficient of correlation of 0.57. The relationship is significant as shown by p value of 0.0084 which is less than 0.05. Size of commercial bank as measured by total assets has positive relationship with financial performance as shown by coefficient of correlation of 0.4697. The relationship is also significant since the p value of 0.0017 is less than 5%.

#### 4.3.2 Results of Model of Goodness of Fit Test

**Table 4.4: Model of Goodness of Fit** 

R	R Square	Adjusted R Square	Std. Error o		of	the
			Estin	nate		
0.804	0.6464	0.2929	0.004	19		

**Source: Research Findings** 

As shown in table 4.4 above, financial performance is strong positively related to interest rates and bank size. This is shown by positive coefficient of correlation of 0.8. The

coefficient of determination of 0.65 implies that the model developed can explain up to 65% of changes in commercial bank financial performance.

# 4.3.3 Results of ANOVA

**Table 4.5: Estimated Model** 

	Sum of	Df	Mean	F	Sig.
	Squares		Square		
Regression	0.00009	2	0.00004	1.8285	0.3536
Residual	0.00005	2	0.00002		
Total	0.00014	4			

**Source: Research Findings** 

From the ANOVA table 4.5 above, the p value of 0.35 implies that the relationship is significant at 95% since the p value is less than 0.05. The model developed is also significant for prediction.

# 4.3.4 Estimated Model

**Table 4.6: Estimated Model** 

	Unstandardized	Std.	Standardized	t	Sig.
	Coefficients	Error	Coefficients		
Constant	0.0857	0.038		2.2537	0.153
Asset Base	0.0001	0.0001	1.2188	1.8892	0.1995
Interest					
Rates	0.1983	0.16	0.7998	1.2397	0.3408

The model developed from the coefficients in table 4.6 above is Y=0.0857+0.1983X1+0.0001X2 where Y is financial performance as measured by return on assets, X1 is the interest rates and X2 is the size of the bank as measured by value of assets. From the coefficients, the interest rates have the highest effect on financial performance of commercial banks

#### 4.4 Discussion

The study sought to determine the impact of interest rate on bank financial performance in Kenya. The study found that the relationship between interest rates and financial performance is positive with a coefficient of correlation of 0.57. The coefficient of determination of 0.32 implies that interest rates affects 32% of profitability. The ANOVA results show a p value of 0.0084 which is less than 0.05. This implies that the relationship is significant at 95%. The results agrees with those of Gilchris (2013) who found that net interest margin had positive and significant impact on the profitability as measured by ROA and ROE. Locally, the findings concur with those of Otuori (2013) who found that higher interest rates offered lenders in an economy a higher return relative to other countries thus attracting foreign capital leading to increase profitability.

Profitability of commercial banks is positively related to interest rates and bank size with coefficient of correlation of 0.8. The coefficient of determination of 0.65 implies that the model developed can explain up to 65% of changes in commercial bank profitability. The relationship is significant at 95% confidence level with a p value of 0.35. The model developed from by the study is  $Y=0.0857+0.1983X_1+0.0001X_2$  where Y is profitability,  $X_1$  is the interest rates and  $X_2$  is the size of the bank as measured by value of assets. This implies that for every percentage change in interest rates, profitability will change by

0.1983 and for every change in shilling of assets, profitability will change by 0.0001%. The size of the bank was used as control variables. The findings on positive effect of size on profitability is in line with findings by Rachdi (2013) who found that size of banks had effect on profitability through control of cost differences and product and risk diversification. However, the findings contradict those of Saidu and Tumin (2011) who found that size of the banks do not influence the performance of the banks in both countries.

The industry profitability was found to have improved in 2010 from 1.64% in 2009 to 3.02 in 2010, reduced to 2.96% in 2011, 2.54% in 2012, and 3.01% in 2013. This finding agrees with those of Flamini et al., (2009) who found that commercial banks in Sub-Saharan Africa are more profitable than the rest of the world with an average Return on Assets (ROA) of 2 percent. This also implies that commercial banks industry in Kenya has positive returns exceeding the 2% globally taken to be appropriate for commercial banks except for year 2009 as indicated by Yuqi (2008). Commercial banks industry profitability has been stable irrespective of the volatility in interest rates measured by standard deviation.

# 4.5 Summary

Most commercial banks were found to have positive return on assets implying that Kenyan commercial banks have high financial performance. The highest performance was recorded in year 2012 where the best performing commercial bank had a return on assets of 10.4%. The lowest performance was found to be in year 2009 whereby the highest loss made by worst performing commercial bank was -17.47%.

Financial performance of commercial banks improved between year 2009 to 2011 with the number of commercial banks having negative ROA reduce from 11.9% to 9.5% to 4.76% in years 2009, 2010 and 2011 respectively. The performance deteriorated between year 2011 and 2012 with the number of commercial banks with negative ROA increasing from 4.76% in 2011 to 9.52% in 2012. The number of commercial banks with ROA of above 5% was found to move from 11.9% in 2009, to 26.19% in 2010, to 14.29% in 2011, to 19.05% in 2012 and 19.05% in 2013. This indicates the volatile market condition between year 2009 and 2010, 2010 and 2012. However, the performance of commercial banks improved in year 2013 with the number of commercial banks with negative ROA reducing to 7.14% from 9.52%. Almost 50% of commercial banks have ROA of 0% to 3% with around 30% of the banks having ROA of 3% to 5%. This implies that over 80% of Kenyan commercial banks have ROA of 0% to 5%.

Commercial bank lending interest rates in Kenya remained stable from January 2009 to October 2011 after which they significantly rose from 14.72% to 20.12% in December 2011, a level that was maintained up to July 2012 after which interest rates declined to 17.97%. Thereafter, the interest rates have remained stable at 16% and 17%. Interest rate volatility was measured by standard deviation. Interest rates volatility remained below 0.5% but rose to 2.51% in October 2012. From 2012, interest rates remained volatile reaching to 0.6%. Commercial banks' lending rates remained relatively stable in years 2009, 2010 and 2011 but rose from 14.97% in 2011 to 19.75% in 2012, but declined to 17.23%. The study found that the relationship between interest rates and financial performance is positive with a coefficient of correlation of 0.57.The coefficient of determination of 0.32 implies that interest rates affects 32% of profitability.

# **CHAPTER FIVE**

# SUMMARY, CONCLUSION AND RECOMMENDATIONS

#### 5.1 Introduction

This chapter presents the summary of findings, conclusions and recommendations derived from the findings of the study. The chapter also presents the limitations that were encountered in the study with suggestions for further research. It is divided into section 5.2 on summary of the study, section 5.3 on conclusion, section 5.4 on policy recommendation, section 5.5 on limitations of the study and section 5.6 on recommendation for further research.

# 5.2 Summary of the Study

The study sought to establish the effect of interest rates and financial performance of commercial banks in Kenya. The study used a descriptive research design to achieve the research objectives. Multiple regression analysis was used to determine the relationship between interest rates and financial performance measured by return on assets. The study used the return on assets as the dependent variable while lending interest rates was the independent variable.

The study found a significant positive relationship between interest rates and financial performance with a coefficient of correlation of 0.57. Commercial bank financial performance was also found to be positively related to interest rates and bank size with a coefficient of correlation of 0.8. Over 90% of commercial banks were found to have positive return on assets. The highest performance for the period of study was recorded in

year 2012 where the best performing commercial bank had a return on assets of 10.4%. The lowest performance was found to be in year 2009 whereby the highest loss made by worst performing commercial bank was -17.47%.

Financial performance of commercial banks improved between year 2009 to 2011 with the number of commercial banks having negative ROA reduce from 11.9% to 9.5% to 4.76% in years 2009, 2010 and 2011 respectively. The performance deteriorated between year 2011 and 2012 with the number of commercial banks with negative ROA increasing from 4.76% in 2011 to 9.52% in 2012. Commercial bank lending interest rates in Kenya remained stable for the from January 2009 to October 2012 after which they significantly rose from 14.72% to 20.12% in December 2011, a level that was maintained up to July 2012 after which interest rates declined to 17.97%. Interest rate volatility was measured by standard deviation and had positive effect on commercial bank profitability. Commercial banks lending rates remained relatively stable in years 2009, 2010 and 2011 but rose from 14.97% in 2011 to 19.75% in 2012, but declined to 17.23%. The industry profitability was found to improve in 2010 from 1.64% in 2009 to 3.02 in 2010, reduced to 2.96% in 2011, 2.54% in 2012, and 3.01% in 2013. Commercial banks industry profitability was found to be higher than those of developed countries and remained stable irrespective of the volatility in interest rates.

# 5.3 Conclusion

The main objective of this study was to determine the effect of interest rates on financial performance of commercial banks in Kenya. From the finding above, the study concludes that interest rates have significant positive effect on financial performance of commercial

banks in Kenya at 95% confidence level. The relationship between interest rates and profitable was also found to be linear with increase in interest rates leading to higher profitability. The study also concludes that interest rate volatility has positive effect on profitability of commercial banks.

The study further concludes that commercial banks in Kenya are profitable with over 90% of commercial banks having positive financial returns. This is shown by the positive ROA as well as the rising ROA over the period of analysis. The study also concludes that the size of commercial banks has effect on profitability of commercial banks where the big commercial banks have higher profitability. Finally, the study concludes that the model containing interest rates and size of commercial bank can explain 64% of the changes in commercial banks profitability.

#### 5.4 Limitations of the Study

The study was faced by a number of limitations. First, this study made use of return on assets as measure of financial performance. There are other measures of financial performance including return on equity (ROE), net interest margin (NIM), return on capital employed (ROCE) among others. Secondly, the study relied on secondary data which had already been compiled by the Central Bank of Kenya. Data was used just as obtained without any adjustments and the researcher had no means of verifying for the validity of the data which was assumed to be accurate for the purpose of this study. The study results are therefore subject to the validity of the data.

Thirdly, the study was specific to Kenya and therefore suffers from the limitations of country specific studies thus cannot be generalized to banks in other countries other than

Kenya. Fourthly, the study was based on five-year data on performance and also on interest rate. Thus the period covered may be recent but is not long enough to take care of the fluctuations in the variables as well as major events in the banking industry in Kenya.

# 5.5 Policy Recommendation

Based on the study findings, the study makes a number of recommendations to be considered for policy formulations. First, commercial banks lending rates have positive effect on commercial banks profitability. This is because higher lending rate implies more revenues to the commercial banks which may not be crowded out by reduced demand for loans. This implies that the demand for loans in Kenya is inelastic and hence insensitive to changes in price for money (interest rates). To cushion consumers from exploitation by commercial banks, the Central Bank need exercise their monitoring roles strictly and discipline any commercial banks that may be increasing the interest rates arbitrary. Further, policies need to be put in place to shield bank lending rates and ensure monitoring the same. In addition, in times of poor performance of commercial banks and the need to boost their profitability may be necessary for their role in economy, Central Bank of Kenya should come up with monetary policy that will lead to rise in interest rates and hence improving banks profitability.

The management of commercial banks also need to develop polices and investment sources that diversify income since interest rates only explain 33% of the changes in profitability. Diversifying the commercial banks source of profitability from the over reliance on the interest rates related sources and explore on other avenues of achieving high profitability will be vital. In addition, the management of small and medium sized

banks need to develop ways of ensuring that their banks grow to large banks since increase in bank size positively affects profitability

# **5.6** Suggestions for Further Research

Based on the limitations of the study, findings and experience of the researcher over the research period, the study has numerous areas where further research can be done. First, while interest rate is the main determinant of commercial banks profitability since they trade in money. Further research can therefore be done incorporating other determinants of commercial banks profitability and not only interest.

Further research should be done in different country to enable generalization of the findings. In addition, some study can be carried out using data from commercial banks as opposed to data availability from Central Bank of Kenya. This will improve the reliability of the financial information. Further study can be done on other firms like microfinance institutions, pension funds and other financial institutions. Lastly, the study recommends that there is need to do another study in the banking industry that makes use of other control variables in order to show the impact of interest rate on bank performance not only the size.
