ABSTRACT

The availability of water to a large population in the world in adequate amount and required quantity is of prime importance. Water being a basic need to human beings and useful in various sectors should be properly and adequately planned. Resources should be allocated for the natural resource to be used for supplying and distribution to consumers in the town.

Planners, especially Urban planners, must ensure the proper implementation of various water supply projects in the light of minimizing the problem intended (i.e. solving water problem shortages) without causing hazard to the environment. What the study seeks to do is to deliberate on the factors affecting water shortages in Nakuru Municipality. It will further, in trying to analyze water shortages, discuss ways in which the problem can be minimized.

The project will be done generally through observation and examination of the existing water shortages in the town - with respect to the water demands in the town.

The number of personnel interviewed in this study were many and various residents, industrialists, commercial traders in town and Nakuru Municipal employees and administrators.

This thesis will have five chapters:-

- Ranging from Chapter
1. Introduction and problem statement.
 2. Literature Preview.
 3. Facts about study area.
 4. Data Collection and Analysis.
 5. Conclusions and Recommendations.
