

## Abstract

Titles of papers describing new species of trematodes, cestodes and acanthocephalans from African vertebrates were used to study the distribution of these parasites in Africa. The African continent was divided into six regions. Parasites were arranged in lists according to their hosts and regional distribution.

A collection of trematodes made in Kenya in 1962-1965 was analysed. Two new species were described, and a list showing records of new hosts and locations made.
