

ABSTRACT

We are proposing a SIG as an extended forum to build a sustainable network and resource repository for practitioners and researchers engaged in community centered collaborative design in developing countries. In structured discussions and an open cross-cultural dialogue, we attempt to build a practical and theoretical foundation based on success and failure stories, challenges and systematic approaches to such HCI. We will explore specific themes around time, trust and values, expectation management and transferability/ sustainability of localized projects. We intend to explore how to document and transform lessons learned into systematic approaches to be deployed in different contexts.
