ACKNOWLEDGEMENTS

My thanks are due to the Dean's Committee of the University of Nairobi for providing much needed financial support in form of a Research Grant which was administered through the vote 500-655-337. Without this support the realisation of the results of this project would have taken a long time.

I am grateful to Professor Lucia Omondi, formerly the Chairperson of the Department of Linguistics and African languages and currently the Principal of the College of Education and External Studies of the University of Nairobi for giving useful ideas and direction at critical stages in the development of this work.

This work has immensely benefited from detailed, painstaking and perspicuous comments, guidance and foresight in the planning, development and realisation from its Supervisor, Prof. Okoth Okombo. I am greatly indebted to him for helpful Supervision, comments and encouragement.

I would further like to thank Professor M. H. Abdulaziz of the Department of Linguistics and African Languages of the University of Nairobi for his encouragement, guidance and material support which has contributed enormously in the realisation of the results of this project.

The typing and organisation of this manuscript and its data was an excruciating exercise. I am therefore grateful to the Management of Lina Communications Services of Nycri especially Aisha Wairimu for providing the requisite technical and secretarial services.

I am thankful to my wife, Mrs. Ruth Karimi Ndungu, Dean of Curriculum and Principal Lecturer of Mathematics at Kamwenja T. C. for showing interest in the statistical representation and interpretation of the students' performance in English and for providing the requisite assistance.

Finally, I am indebted to my family who were a source of encouragement, support and inspiration during the four year tenure of this study.
ABSTRACT

The objective of this study was to identify as well as analyse and describe both quantitatively and qualitatively the emerging IL syntax of a sample of Kikuyu Learners of English as an L2. The cross-sectional study which used a sample of 864 learners of English from the Northern Kikuyu dialect was specifically designed to examine the extent to which Kikuyu contributed to the formation of non-target syntactic constructions. The learners comprised four hierarchically organised groups of English learners with four varying levels of English proficiency. Group four in Form Two had the highest English proficiency level while the next higher level of English proficiency was in group three in Form One. The next lower level of English proficiency was in group two in Standard Eight while the lowest level of English proficiency in this study was in group one in Standard Seven.

The research instrument consisting of a battery of grammatical judgement tests and composition production tasks suitable to each proficiency level was administered to the groups. The composition responses were marked in a mini-conference of experienced teachers of English using error analysis approaches for compliance with target language norms and in terms of comprehensibility, intelligibility as well as frequency.

In the course of the interpretation and analysis of the subjects' responses using conventional error analysis methodology, a detailed typology of the syntactic deviations was established and each type of syntactic deviation was discussed as to its definition, sources and implications for language learning. It was assumed that such analyses would contribute a better understanding of IL and give better insights into the strategies and processes that are employed by
L2 learners of English as well as reveal the status of IL syntax of KLE with respect to learners linguistic competence in English.

Comparison of the different syntactic deviations with the processes and strategies which are presumed to be responsible for IL formation showed that there was some relationship between formation, distribution and frequency of NTL constructions and the five processes proposed in Selinker. As a result of the observed deviations and NTL constructions in the IL syntax of KLE, the performance in English and the ability to pursue studies in the English medium by KLE tended to be lower in relation to the expectation of the prescribed syllabus. The findings confirm the allegations broached in the statement of the problem and provide answers to the research questions of this study. The research reported here is organised as follows:

Chapter one is the introduction in which we present the background of the study by delineating and specifying the linguistic situation, the research problem, objectives, the hypotheses, rationale and the scope of the study. Chapter two provides the theoretical framework while chapter three reviews the literature and explores the insights as well as the theoretical and methodological avenues which forms the basis and approaches which this study adopted. Chapter four is the research design and methodology while Chapter five presents the data analysis and findings. Chapter six is the discussion of findings while Chapter seven is the conclusion in which we provide the study summary, conclusions recommendations and implications.

The Bibliography shows the works consulted while the appendices contain the questionnaires and the data of NTL syntactic constructions.

CHAPTER ONE
INTRODUCTION

1.1 BACKGROUND TO THE STUDY

The central focus of this study is the error analysis of anomalous English syntactic forms in the interlanguage of Kikuyu English language learners. Selinker (1972) defines interlanguage (IL) as "a separate linguistic system" based on the observable output (both errors and non errors) which result from the learners' attempted production of a target language (TL) norm. English is learnt and taught as a second language (ESL) in a multilingual and multi-ethnic setting in Kenya, where indigenous languages show great linguistic diversity, (c. f. Whiteley (1974), Heine & Mohlig (1980), and Cheshire (1991 : 391). The few studies by Hocking (1974), Bright and McGregor (1970), Gatherer (1980) and a number of unpublished M. A. Theses by post-graduate students (cf Ochwaya (1992), Kibet (1992) and Akinyi (1992) have shown that the structure of English is different from the structure of other languages of Kenya. Such structural differences are pedagogically significant as the first languages in Kenya are extensively used in various socio-cultural settings for intra-ethnic communication. They are also used for the teaching of initial literacy. English is acquired and spoken as an L 1 in Kenya by a very small minority (less than one percent) who are mainly descendants of British settlers. For the majority of Kenyans, English is learnt and used as a second language mainly in the formal establishments due to its centrality in the lives of the Kenyans.
The last fifty years have witnessed the emergence of English in Kenya and other developing countries as an important language of education and international communication. English is increasingly being used in many countries as a second language while in others it is used as a foreign language (Cheshire 1991). In Kenya it serves as a vital medium of education and administration. An important reason for the emergence and expansion of English in Kenya has been attributed to the increasing demand for education and scientific knowledge. Educationists and administrators in Kenya have correctly perceived the connection between English and Science. They have recognized the important role of English in the acquisition of Science and Technology. English has been identified with the national interests and the modernization process generally.

Despite the increasing importance of English leading to a corresponding demand for its teaching, pedagogical and sociolinguistic problems related to its teaching and learning have not been carefully studied. The concept of teaching English as a second language was incorporated in the Kenyan educational system without due consideration of the sociolinguistic and cultural background of the learners. Yet researchers in Second Language Acquisition have shown in a number of recent publications (Corder 1967), Richards (1974), Duskova (1969), Ellis (1985), Odlin (1989), the importance of the L1.

They have postulated that the first language plays an important role in the learning and teaching of the L2. Unfortunately most indigenous languages in Kenya have not received adequate analyses and description.
Odlin (1989) has for example emphatically pointed out that features of syntactic problems among second language learners show wide variations from different ethnic communities. This observation is relevant in Kenya as learners of English from different ethnic communities generate varieties of linguistic constructions which do not conform with the TL rules due to a number of reasons. Linguistic differences between L1 and L2, cultural backgrounds, quantity and quality of L2 input, the language aptitude, educational background and the language distance between L1 and L2 are important variables in second language learning. This observation implies that speakers of different indigenous languages make specific phonological, lexical and syntactic deviations when using English. They also employ different second language learning strategies and processes relative to their respective first languages.

The first languages are used for intra-ethnic communication and social interaction. They are also used in places of worship at local levels as well as the teaching of literacy skills at lower primary school levels. This has been acknowledged as an acceptable and viable policy by educational planners and linguists. But, as indicated earlier systematic studies in most of these languages of Kenya are sketchy, (Swahili is an exception). Some languages lack codification, standardization and elaboration so that they are in harmony with modern times and technology. Consequently, as educational planners in Kenya have argued, instructions in these languages is not capable of going beyond lower primary school and basic literacy levels. Furthermore, the indigenous languages lack comprehensive
literature (an attainable objective). As a result of this neglect, there is very little reliable information on the syntactic, phonological and semantic properties of the local languages. Studies regarding their linguistic histories are sketchy. The teaching of local languages is largely based on linguistically unreliable data and descriptions that were made by Christian missionaries who were not trained in linguistics. It has been pointed out in a number of recent second language acquisition studies, Corder, (1981), Ellis (1989), Richards (1971) and Hatch E. (1978) that the first language facilitates and influences positively or negatively the acquisition of second language proficiency and competence. The teaching and learning of English in a multilingual environment assumes special significance as the present study shows that the learning of English is characterized by varieties of NTL constructions at morphological, syntactic and semantic levels leading to some significant deviations in the L2 of Kikuyu learners of English.

Since the structure of English is different and the communicative needs of the learners vary enormously, it is only logical that the type of sentence constructions that learners generate are interpreted in relation to the linguistic rules that are available to the learners. These differences are pedagogically significant as learners and teachers have to overcome both linguistic and communication difficulties in order to attain acceptable competence and proficiency levels in English which can support learning.
Gikuyu is the dominant L1 among the inhabitants of Central Kenya whose population now stands at 4.45 million (Kenya Population Census, 1989). It has a number of distinct dialects which are mutually intelligible and are spoken with local variations in phonology, vocabulary and grammar. There are a number of variations in phonology manifested mainly in Ki-Mathira and dialects of Kirinyaga districts (c.f. Mutahi, (1983: 10-20)). Local dialectal variations in vocabulary modification is more pronounced in the southern dialect in Kiambu and the Northern dialect of Nyeri. Speakers of Gikuyu in rural Central Kenya who formed the bulk of respondents in this study have limited linguistic and socio-cultural contact with native speakers of English. Opportunities to acquire and use English from these contacts are few. Indeed, they have no practical need to use English as the social function of communication is realized through the medium of Gikuyu. This is understandable for the social and cultural function of languages are adequately catered for in Gikuyu. The exposure to English is provided in the classroom by non-native teachers of English whose performance varies considerably relative to the quality of education received at school level, language proficiency and the training they underwent as teachers of English. Gikuyu is used in many domains of social communication such as worship and entertainment at local levels. It is also used in the teaching of literacy skills at lower primary school levels. English to them represents modernity and is associated with education and western ways of life. Its learning and teaching is confined largely to the school setting, where a prescriptive syllabus is used. It should not be construed that the school is the only source of getting English input.
Indeed, learners can get English input from diverse informal sources such as social interaction, listening to the radio, watching television, reading newspapers, books and magazines. English acquired from these sources does not necessarily conform with acceptable norms of standard language. It contributes additional variation to the IL of the language learners. As a result of these diverse sources, it is natural that the learners would resort to employment (consciously or unconsciously) of communication strategies (cf. Tarone (1979, 1980), Tarone, Cohen & Dumas 1976), Faerch & Kasper (1980), and Kellerman (1977) when faced with circumstances which need the use of TL based on the varied sources of exposure to English. Their IL contains some deviant sentence constructions which differ significantly from the standard norm. Such sources which contributed to the formation of IL were identified whenever possible and practicable. Unfortunately such sources were not uniformly available and accessible to all the learners and therefore was not used as a source of data for this study.

Pre-research survey which was conducted for this study revealed that the language scene is currently undergoing rapid changes as a result of access to education and social mobility. The increased use of the print and electronic media and the growth of the pop culture as well as viewing of soap opera on television too has accelerated the use of English especially among the youth. In the urban centres, for example, a new form of sociolect, popularly referred to as 'sheng' (cf Osinde (1986). Abdulaziz and Osinde (1997) has emerged in Nairobi as a means of intra-group communication. Learners sources of English input vary enormously.
Those in the urban centres generally tend to receive a richer input than their counterparts in the rural areas. While Gikuyu remains the dominant medium of communication and social interaction, its users especially the youth, tend to resort to code-switching and code-mixing where English lexical items and expressions are freely mixed with Gikuyu. Although these changes and patterns of language use remain uninvestigated, their influence in the learning of English cannot be overlooked in this study for the following reasons:

(i) The model of English that the learners are exposed to in the formal school setting closely resembles the written Standard British English (SBE). The opportunities to use and practise this model are limited to the transactional uses of the language within the classroom setting. The use of "correct English" is perceived in terms of this model which may be at variance with the communicative and social needs of the users.

The learning and teaching of English is monitored and guided for pedagogical purposes by the classroom teachers who provide the correct use and usage. Since the teachers themselves may not have an absolute mastery of this model, they provide learning and teaching under the guidance of prescribed textbooks and teachers' handbooks which generally reflect the norms of standard English.

(ii) The learners are exposed in the informal setting to many contexts in which different varieties of English such as the American English (AmE), journalese and legalese, etc., are used.
Some of the varieties which the learners are exposed to contain specialized jargon and slang while others contain nonstandard and colloquial forms of English which are at variance with the standard model of English the learners are exposed to at school. The use of some of these forms of English by learners within the school sometimes leads to deviant constructions. Therefore, wherever possible the deviant constructions from these sources will be discussed as they have some bearings to the notion of transfer in language contact situations and the development of pidgin.

(iii) There is also the phenomenon where L1 features are transferred to English as a result of learners' employment of communication strategies which lead to deviant constructions in the TL. (Faerch, Claus and Gabriele (1980). In the formal language learning situations, the teacher facilitates the learning of the correct English structures and their communicative attributes whereas in the informal setting the learners make decisions and choices about the TL according to the rules available to them.

(iv) The teachers of English are not native speakers of English. They have learnt English as a second language and have been trained to teach English. In some cases especially at secondary school level, the teachers do not share the same L1 with the learners. Their effectiveness and ability to teach English competently as well as identify NTL constructions depends on a number of factors namely:
the training they underwent, the linguistic background of the learners, the learning/teaching environment, the availability of resources such as books and the language aptitude of the learners. The teachers have enormous responsibilities for determining what constitutes incorrect usage relative to the standard norm. But in the face of changing usage coupled with a possibility of an emerging variety of Kenyan English, the teachers lack the guidelines reflecting trends in language change and emerging patterns of usage. Besides, there are no well established norms and standards of acceptable proficiency of Kenya variety of English to be adopted and emulated.

The learning and teaching of English is decidedly influenced by extra-pedagogic factors. This is for instance highlighted in a 1973, UNESCO publication which suggests that:

"Social and cultural factors assume overriding importance in the teaching and learning of languages for general instruction. Teachers increasingly recognise that the crucial difficulties of language learning cannot be understood in purely pedagogic terms. Languages are not confined into the narrow limits of the classroom; Social environment often determines the success or failure of language acquisition."

(UNESCO (1973 : 7) - Anthropology and Language Science in Education Development)

The interlanguage of L2 learners and the type of grammatical errors are largely influenced by the following factors which have been identified in Ellis (1985 : 17 - 18) and Stern (1983 : 337 - 415)
i) The learner's L1 background

ii) The quality of teacher competence in English

iii) The sociolinguistic and cultural background of the L2 learners and inherent motivations

iv) Availability of learning/teaching resources such as textbooks the teacher's handbooks and learners L2 aptitude.

v) The structure of the target language and its language distance with the L1.

In this section, we have examined the multilingual background in which English is learnt as an L2 by speakers of Gikuyu. Like other L2 learners in Kenya, Kikuyu learners of English encounter linguistic difficulties leading to production of erroneous sentences in their interlanguage which do not conform with accepted norms of L2. This study adopted the definition of the term 'errors' and recognized the distinction made by Corder (1981: 10) who proposes that:

"It will be useful therefore hereafter to refer to errors of performance as mistakes, reserving the term error to refer to the systematic errors of the learner from which we are able to reconstruct his knowledge of the language to date, i.e. his transitional competence".

Research evidence has shown that the errors which a speaker of L1 makes in attempting to communicate in L2 are the same as those made by a native speaker acquiring his first language (cf Bailey, Madden and Krashen (1974), Dulay and Burt (1974) Ravem (1974).
These errors provide the researcher with evidence of how L2 is acquired. It is for this reason that we take a learner's errors, not as mistakes or deviant forms Corder (1967), but rather as part of a separate genuine linguistic system. These errors are usually systematic and their systematicity furnishes evidence of an organized grammar. This explains the reason behind Corder's (1971a) statement that the speech of an L2 learner is a language having a genuine grammar. In this study the term "deviation" is adopted instead of the word "error" in order to account for departure from the standard norm since the term error tends to impose negative connotations while the expression non-target-like (NTL) sentences will be used instead of erroneous sentences.

We have noted that interlanguage research is relatively new and few studies have been published in this field. In the area of interlanguage syntax, researchers such as Cancino, Rosansky and Schumann (1974), Bailey Madden & Eisenstein (1976), Ravcin (1974) and Huang (1974) etc. have for example, used longitudinal-observational based case studies to investigate the acquisition of negation, interrogatives and auxiliary in an L2 naturalistic simultaneous setting. These observational case studies corroborated Dulay & Burt's claim that "the L2 learners actively organize the L2 speech they hear and make generalizations about its structure as children learning their first language do."

Dulay & Burt 1972 : 236
Other researchers such as Duskova (1969), Scahtcher (1974) and Lo Coco (1975) used cross-sectional error analysis as a methodology to study the interlanguage syntactic errors of large groups of learners of different language backgrounds. The generalizations made in these studies support the view that the L1 is significant in the acquisition of L2.

1.2 STATEMENT OF THE PROBLEM

Enormous resources have been committed to the learning and teaching of English as an ESL in Kenya. This has been found necessary as English occupies an important place in the lives of Kenyans generally and it is used extensively as a medium of education. Competence in English is an important requirement for career advancement and occupational mobility. The designed English language learning/teaching materials provide opportunities for exposing learners to a wide variety of contexts in which they can use English correctly and communicatively. Despite the efforts that have been taken to improve the quality of English learning and teaching, pre-research observations have revealed that the learners' spoken and written English contain ungrammatical sentence constructions which hinder their ability to communicate correctly and intelligibly. These observations are corroborated by reports from the KNEC of 1989, 1990, 1991 and the print media such as the Daily Nation (June, 1991) and the Standard (1987, 1991) in their observations that sentence construction errors in students' written and spoken English impair their communication ability in the target language.
The consequence of this is inability to produce TL constructions which conform with established norms of acceptable and grammatical English. This affects their performance in English leading to overall decline in the quality of education.

At the moment, our knowledge about the nature and origin of syntactic deviations in the interlanguage of Kikuyu learners of English is rather sketchy, vague and fragmentary as expressed in the few existing publications mentioned earlier. The generalizations and conclusions made in these studies do not address the specific L2 linguistic difficulties of each of the ethnic communities in Kenya. They were made on the assumption that all the L2 learners in Kenya constitute a homogeneous linguistic community and therefore experienced similar linguistic difficulties. Furthermore most L1s in Kenya show internal dialectal differences. Yet, recent research studies on L2 learner difficulties of particular ethnic communities in Kenya by postgraduate students as indicated earlier have produced evidence showing that L2 learners of different language backgrounds experience L2 differently.

Corder (1981) and others suggested that an L2 learner develops his own transitional language as he attempts to achieve the target norm. The emerging learner language which Selinker called IL was assumed to be constantly changing as it approximates target-like forms. It was also assumed that it was possible to describe the learner language from the same L1 background along the interlanguage continuum and the strategies they employ by tracing successive stages of IL development over a period of time.
The strategies that shape the learner's L2 output have generated much controversy in second language acquisition studies. Some researchers, for example, Briere (1968), Weinreich (1953) and Moulton (1962) have identified transfer from the L1 as the main feature that influences the second language learning process by using the C. A. framework. Others, like Dulay and Burt (1972, 1974) focused on non L1 factors and point out that IL is mainly influenced by universal language learning strategies such as markedness of a particular TL form. They argue that it is the L2 system that guides the acquisition process and imposes limitations rather than the L1 of the learner. They suggested 'a creative construction process' in L2 acquisition.

It is evident from the two antagonistic views that an understanding of the factors in interlanguage cannot be achieved on the basis of the two arguments as they impose severe limitations in the investigation of all the variables in the L2 output and the factors that interact to form interlanguage. Furthermore vexing problems associated with the elicitation process and the handling of many variables as well as the interpretation of a large body of inconsistent and indecisive results have tended to indicate that the devising of a clearly worked out theory and methodology is a difficult task.

This study was therefore designed to investigate the L2 output of Kikuyu learners of English within the interlanguage framework in order to discover the factors in the formation of non-target constructions. The study was carried out in particular reference to Kikuyu learners of English in the formal classroom setting.
We specifically investigated the interlanguage syntax of four groups of learners in order to understand the nature of the learners' interlanguages. The study focused on both the written and spoken forms of English. The central questions being answered in this study was:

What were the strategies that shape the interlanguage syntax of Kikuyu learners of English?

This study attempted to answer the above question by finding out what characterized the interlanguage of Kikuyu learners of English and could be attributed to the L1 and therefore explainable by comparison between the L1 and the TL, and which ones could be attributed to other factors such as overgeneralization, simplification, regularisation and differentiation.

Studies reported in Ravem (1968) who used longitudinal observational research design in his case studies in a naturalistic setting and those reported by Dulay and Burt (1972) where cross-sectional approach was used formed the stimulus for this study. This study employed a cross-sectional research design and differs however from both studies in its use of four large groups of subjects, at four different stages of L2 acquisition, in the procedures used in choosing NTL constructions and the description of different grammatical categories. This study is also different as it departs from similar works by Hocking (1974) who refers to the L2 learner errors as "mistakes" rather than possible legitimate deviations.

1.3 **OBJECTIVES**

The general aim of this study was to study the interlanguage of Kikuyu learners of English and to investigate the causes and nature of syntactic deviations. The specific objectives of this study were:
i) To identify, analyze and describe the corpus of syntactic deviations culled from the Interlanguage sample of Kikuyu learners of English.

ii) To investigate the extent to which L1 contributes to the formation of syntactic NTL sentences in the interlanguage of English.

iii) To study non-linguistic factors which may have influenced second language generally and how they relate to the production of NTL sentences.

iv) To provide a better understanding of IL processes in the formation of non-target-like sentences.

v) To recommend and give suggestions on how to ease the learning problems and alleviate the teaching difficulties in the ESL.

1.4 **HYPOTHESES**

To investigate the stated research problem in relation to the stated objectives, the following two hypotheses were tested:

i) The processes and strategies adopted by the L2 learners in their attempt to produce target English syntactic structures lead to the formation of an interlanguage whose syntax is distinguishable from that of the target language.

ii) The syntax of the Interlanguage of Kikuyu learners of English varies relative to the learners' degrees of exposure to the target language.
The first hypothesis proposed that the nature and type of processes and strategies employ by different groups of L2 learners in their interlanguages lead to syntactic differences between the TL and the interlanguages. In this regard, the IL of learners who used the strategy of learning and such processes of transfer from native language, overgeneralization, and transfer of training displayed more NTL sentences than that of those who used few strategies and processes in their IL. What this means is that Kikuyu learners of English in their second year of secondary education will tend to employ few strategies and processes in their IL as the IL production approximated the TL norm than their counterparts in Standard Seven. Learners of English in their second year of secondary education will produce few NTL English sentences compared with Standard Seven Learners of English. In order to test this hypothesis the following research question was considered.

To what extent did the employment of specific strategies and processes contribute to syntactic deviations in second language learning?

The null hypotheses proposed that the use of specific processes and strategies in the IL of L2 learners is not significant among the four groups of learners in the formation of NTL sentences. The apparent decrease in the number of NTL sentences among the learners in the second year of secondary school and the relative increase of NTL sentences in Standard Seven has no relationship with the type of processes and strategies the learners of English had employed.
The second hypothesis stipulates that there are differences in the syntax of learner language based on the level of exposure to the TL. Learners whose level of exposure to the TL is lower produce more non-target syntactic constructions. This means that learners in the second year of secondary school education who have been exposed to English for about ten years have a higher level of exposure to English and competence in the TL is higher than their counterparts in Standard Seven who have had only seven years of formal exposure to English. Hence, the interlanguage of learners in the second year of secondary school education display fewer syntactic differences from the TL than the IL of learners in Standard Seven.

In order to test this hypothesis the following question was posed.

Does increased exposure to English lead to acquisition of TL which approximates the standard norm?

The null hypothesis proposed that there are no significant syntactic differences in the interlanguages of Kikuyu learners based on differences in the levels of exposure to English. This means that the interlanguages of the four groups of learners display no differences in syntactic closeness to the TL.

Although the two hypotheses appear to be different, they address the same linguistic phenomenon which is concerned with syntactic characteristics of the interlanguage of Kikuyu learners of English in that their central focus is the occurrence of non-target syntactic constructions.
The results of this study were therefore interpreted in terms of whether there was no significant differences in the number of non-target syntactic constructions among the four groups of learners as a result of different levels of formal exposure to English. The results were also interpreted in relation to the degree which the use of psycholinguistic processes and specific communication strategies contributed to the formation of NTL syntactic constructions.

1.5 RATIONALE FOR THE STUDY

The acquisition of English competence occupies a central place in the lives of Kenyans as English is used in many domains of life. At the national level, English is used as a language of communication in administration, education, media, business transactions, technology and in legal institutions. The students need it most as it is used as a medium of education, science and research. It is also taught as a subject and it is used as a yardstick for selecting those who enter job training and higher education. The extensive use of English in Kenya by speakers of different indigenous languages in many contexts for varied purposes creates many linguistic, educational, administrative and language planning constraints. The implementation of an effective and successful target language learning curriculum that uses appropriate teaching materials and methods in which the needs of the learners are addressed should be supported by empirical research.
This study is therefore justifiable on various grounds:

1. Firstly, as Robins (1964: 223) states, the acquisition of the syntactic component constitutes an important facility in grammar. In the Standard Theory of Transformational Grammar, the syntactic component is basic to grammar as it is the generative part. It enables learners to choose and organize the acquired meaningful structures according to the rules available to them. Roderick (1968: 281) asserts that syntax is fundamental in that both semantic and phonological components operate on information provided by syntax. Although Chomskyan Grammar has abandoned many of its assumptions in Standard Theory Stage, the centrality of syntax in the Theory of Grammar has not been abandoned. If these are valid comments, then an investigation of the interlanguage syntax of Kikuyu learners of English was justified as it affects how L2 communication is organized.

2. Secondly, the model of English prescribed in the educational system in Kenya resembles the SBE. Although no objection to the use of this model has appeared pertaining to the Kenya situation, no research has yet been conducted concerning the attitudes of Kenyans towards the English used or the attitudes about the kind of model to be taught and emulated in the educational system. Despite the rigorous teaching of this model the type of English produced by learners as this study shows departs from the prescribed
model and has its own characteristics. This study is justified as it seeks to discover the characteristics of the emerging interlanguage with implication to a possibility of an emerging variety of Kenyan English.

3. Thirdly, production of English IL syntax that approximates TL is socially and pragmatically justifiable as it is concerned with the ability to communicate meaningfully and intelligibly in the TL. L2 learners need English syntax most fundamentally in order to achieve both functional and social interaction as well as the communicative needs that conforms with the TL norms. Studying English IL syntax was justifiable since it enabled the investigation of the IL characteristics at different stages as it evolves to approximate TL - like constructions.

4. Fourthly, mastery of English syntax is pedagogically significant since formal learning and teaching of English strives to approximate the TL norm as English is compulsory. The main objective of learning and teaching English is to approximate the standard norm. Therefore, enormous resources have been committed to the learning and teaching of English. If these observations are relevant, then it was important that the study of the nature of IL syntax phenomenon which has some bearing towards the quality of English learnt be investigated. The results of a study of this nature should benefit curriculum developers, researchers, teachers of English and textbook writers who need to
understand how learners organize their L2 input in order to communicate in TL. It was therefore hoped that this study would contribute to a better understanding of SLL process generally, specifically to the L2 learner needs leading to preparation of relevant teaching materials and methods.

5. This study was justifiable as it is hoped that it will shed some light on the strategies that second language learners use in their interlanguage communication.

7. An important justification is concerned with a theoretical view on SLA as theoretical research in TL can also profit considerably from an applicational perspective particularly on second language educational linguistics.

8. Not all aspects of linguistic difficulties of L2 learners have been investigated fully and described exhaustively. Existing studies which have been conducted elsewhere and in Kenya using Contrastive Analysis (CA) and more recently EA have attempted to discover the origin and causes of L2 errors. Although recent investigations have
focused on second language acquisition, very few studies have been conducted on interlanguage. Tarone, Swain and Fathman (1976) noted that very few SLA studies have been replicated by other researchers. They point out that the results of a study can only influence the teaching of L2 if they are replicated in some ways, possibly by other researchers using different methodologies. Most of the interlanguage studies have been conducted in situations where those being investigated i.e. the acquirers were in linguistic environment dominated by speakers of the target language. This research therefore contributed to what Selinker (1974) pointed out that; interlanguage hypotheses should be extended to those non-simultaneous child language acquisition settings where the major sociolinguistic variable is the absence of peers who are native speakers of the target language.

The investigation hopes to provide evidence of the procedures that the L2 learners employ to discover the second language. In contributing information on strategies the learners' employ, the study would be contributing some theoretical aspects of second language acquisition (SLA).

Finally, this study is significant and justified in that it was conducted in an ESL learning environment where native speakers are absent. Most SLA studies have been conducted in naturalistic simultaneous ESL learning environments which were dominated by TL speakers. Consequently L2 learners received L2 input from speakers of TL. The findings and generalizations from such studies
must have been influenced by the input provided by native speakers unlike our present study where the native speaker variable is absent. In this study, the L2 learners received L2 input mainly from the learning/teaching environment. To the best of our knowledge, studies specifically based on the concept of interlanguage in reference to Kikuyu learners of English are non-existent. Those which have investigated the acquisition of English among the Kikuyu learners of English for example, Chege (1994), Njeng'ere (1994) have mainly focused on contrastive analysis and error analysis approaches. This study is therefore significant as it contributes additional information to the understanding of the processes in SLA and the difficulties experienced by Kikuyu learners of English in the area of syntax acquisition.

1.6 SCOPE AND LIMITATION

The research reported in this investigation examined the interlanguage syntax of 864 learners of English as a second language. Its main objective was to investigate the reasons for their use of English syntactic structures that do not conform with TL norms and the strategies they employed in their interlanguage communication. The study covered the acquisition of English syntax within the formal classroom setting. It is restricted to speakers of the Northern dialect of Gikũyũ which is spoken in Murang'a north and most parts of Nyeri District except Mathira Division (cf. Mutahi 1983). It does not therefore include speakers of the southern dialect and many others spoken in many parts of Kenya. The investigation was a cross-sectional study which sought to synchronically analyse, compare and describe the present day interlanguage of Kikuyu learners of English. It focused on the syntactic constructions of both
written and spoken forms of English within the classroom setting among four
different groups of learners because as Gorman (1971) points out,

"Language use in the classroom is to use Herman's phrase, 'task oriented', and the use of English is
prescribed for many purposes".

(Whiteley, 1971:218)

The study was specifically limited to the realization of syntactic
categories of tenses, auxiliaries, plural, prepositionals, relative clauses,
determiners, adverbials, conjunctive elements, negation and interrogatives.
Although the study focused on the above ten categories, the study recognized
that some rules are based on morphological conditions. For this reason, they
must be accounted for and explained by using such morphosyntactic rules which
govern word boundaries, word classes, plural, tense markers, and word
formation rules. There were other syntactic categories which, though
important fall outside the scope of this study. Such syntactic categories were
only used marginally as part of extended data in support of issues raised in the
discussion where elaborate substantiation was deemed necessary.
CHAPTER TWO
THEORETICAL FRAMEWORK

2.0 INTRODUCTION
This chapter is concerned with the delineation and elaboration of the theoretical framework which was adopted in the study of the acquisition of English syntax by Kikuyu learners of English. The proposed framework sought to account for the occurrence of syntactic deviations and NTL constructions while explaining the processes in learner-language development.

This study is based on the interlanguage theory which postulates the structural autonomy of the developmental stages of learner-language and its inherent characteristics as systematicity, variability and rule-governed. The underlying processes in this theory enabled us to infer psycholinguistic explanations of the processes and strategies in the formation of learner-language while using Error Analysis approaches as crucial procedures in the identification, explanation, categorisation and description of deviations and NTL constructions.

2.1 THEORETICAL FRAMEWORK
This study was based on the theory of Interlanguage as explained and elaborated in Selinker (1972) and some of the postulations of the Error Analysis approach as formulated by Corder (1973:265-293)
Selinker (1972:209-231) used the concept of IL to refer to the 'separate linguistic system' which is hypothesizable from the observed output (both target-like and non-target-like) of L2 learners' attempted production of the target language norm.

According to Selinker (1975:140) the learner language does not conform with the TL norms since it displays characteristic differences as it develops. The learner language is constantly changing. This continuity in change is the often talked about dynamicity and variability in Interlanguage, Dickerson (1975), Ellis (1985:75-86) and systematicity of IL, Nemser (1971:230-231).

De-Camp (1971) and Bikerton (1975) used the notion 'linguistic continua' while Corder (1981:80) referred to Interlanguage as developmental continuum' to reflect the dynamic and changing characteristics of IL.

According to Dickerson (1975:407) Interlanguage exhibits variability at a particular point in time thus providing evidence of change towards the target norm. Besides the notions of developmental continuum and linguistic continua, IL has been characterised as being ordered, hierarchical and systematic.

Adjemian (1976), for example has pointed out that the learner’s IL as a system of rules (variable or not) shows "the existence of an internal consistency in the rules and feature system" which make up IL. According to Adjemian the learner language is permeable and is easily influenced by the L1 through the processes of transfer, overgeneralization and incorporation of L2 forms.
The notion of IL being developmental suggests that it is possible to locate the stage at which a learner is along a developmental continuum. Corder (1971b:149-159), (1974) and Selinker (1969, 1972) maintain that Interlanguages are autonomous systems which are internally patterned. They further point out that ILs employ consistent and recognizable strategies and features which are similar to those of natural languages in the linguistic sense, capable of being studied as autonomous language systems. According to these views, it is possible to locate where a learner is and describe interlanguage along a continuum and consequently make generalizations about the nature and characteristics of the learner-language.

Selinker (1972) identifies five cognitive psychological processes which are central to second language learning. He claims that these processes exist in latent psycholinguistic structure and that interlanguage utterances are associated with one or more of these processes. According to Selinker (ibid) these processes include:-

i) Language transfer which he defines as interlanguage performance due to crosslinguistic influences. The term 'interference' was initially used to describe this process. In this process, learners use some of the elements of their mothertongue in the Interlanguage performance.

ii) Overgeneralization of the TL structures. In this process, the learners extend the domain of certain linguistic rules leading to systematic innovations. The L2 learners have the cognitive capacity for making hypotheses about the TL.
iii) Transfer of training. In this process, learners tend to include in their interlanguage performance NTL sentences due to faulty teaching/procedures and inappropriate learning procedures. Due to these approaches, learners acquire false concepts which they use in their interlanguage leading to production of NTL sentences.

iv) Strategies of second language learning which results from identifiable approach by the learner such as simplification, regularisation, differentiation in order to make the TL easier to use.

v) Strategies of second language communication which involve identifiable approaches by the learner to communicate in the TL in order to overcome TL deficiency and achieve communication such as, for example, paraphrase, circumlocution and prefabricated patterns, etc.

Selinker (et al) maintains that any description of IL must account for the fossilization phenomenon because:

"Fossilisable linguistic phenomena are linguistic items, rules and sub-systems which speakers of a particular native language will tend to keep in their Interlanguage relative to a particular target language."

Nemser (1971:230-231) argues that IL is structurally independent from the L1 and the TL systems. He suggests that IL exhibits frequent and systematic
occurrence of elements which can be attributed to either the L1 or TL. According to Nemser these elements constitute a separate linguistic system from both the L1 and the TL as they exhibit an internal coherence. These assumptions are in agreement with Corder's (1971b:57:64), (1974) and Selinker's (1972) contention that Interlanguages are autonomous systems which are internally patterned.

This study adopted a modified Error Analysis approach for the study of the Interlanguage syntax of Kikuyu Learners of English. The underlying principle in the adopted approach was to provide a framework for identification and classification of NTL sentences in terms of distributional occurrence in each syntactic category and identify a possible psycholinguistic explanation for the origin of each deviant sentence. The Error Analysis component of the approach involved a principled analysis of NTL sentences in the relevant data as the basis for understanding the differences between the IL system and the TL system in the process of the observed Kikuyu learners' acquisition of English as a second language.

The occurrence of NTL sentences provide evidence of the learners' ability to form and test the hypotheses about the nature of the TL. The existence of deviations from the TL norm provide indications of cognitive activities as well as evidence of active learning processes. Error Analysis is basic to the understanding of this process.

In this framework, the learner is viewed as creating for himself an account of the structural properties of the target language. For this reason, Dulay and Burt (1973:257) describe the second language learner as "a cognitive organizer or a creative constructor". Deviations from the TL norm occur when
the type of universal cognitive processing strategies do not lead to the formulation of hypotheses which lead to the production of target-like sentences.

The methods and procedure of Error Analysis approach are elaborated in Corder (1973:257-294). This study adopted the methods and procedure of Error Analysis as elaborated in Corder but preferred to use the term deviations instead of the term errors to identify and distinguish the NTL sentences from the target-like sentences in the IL of L2 learners. The theoretical objective of using Error Analysis approach in this study was to provide an explanation of the nature and origin of NTL sentences by offering a psycholinguistic origin in terms of learners' strategies and creative abilities. The series of successive steps in the Error Analysis approach which this study adopted is outlined in Theo van Els (1984:47) and others as:-

(i) identification
(ii) description
(iii) Explanation
(iv) Evaluation
(v) Prevention/correction

Corder (1973) maintains that the identification of deviant sentences involves interpretation of NTL sentences in context because utterance must relate to its linguistic environment (i.e. assume textual appropriateness). He distinguishes between sentences which are overtly deviant from those which are covertly deviant. Sentences which are overtly deviant are unquestionably ungrammatical in respect to the TL norm. Sentences which are covertly deviant
are grammatically well-formed in terms of the TL norm but inappropriate in the context in which they occur. The identification and description of the origin and nature of the NTL sentences was based on the contexts in which they occurred.

To summarize, the nature of Interlanguage portrayed in the above discussion is as follows:

(i) Interlanguages are autonomous systems which are internally patterned
(ii) Interlanguages are constantly changing and they employ consistent and recognizable strategies.
(iii) Interlanguages are describable at any given stage of their development.
(iv) The existence of deviations play an important part in the formation of TL as learners use them to form and test their hypotheses about the nature of the TL.
(v) The NTL sentences play an important part in the learning process as they form part of the strategies the learners use to create an account of the structural properties of the TL.

The above characteristics were similar to those observed in this study. The learners of English in this study acquired and spoke Kikuyu as a first language. English was introduced to them as a second language mainly at the school setting. The four groups of learners who were used in this study represented four different levels of formal exposure to English. The interlanguages of the four groups represented four levels of language abilities.
with each level providing evidence of the learners' ability to reconstruct English in similar ways. Three theoretical issues are relevant in this study:

The first issue concerns the idea that Interlanguage constitutes a system that is constantly changing. This idea is relevant in this study as four groups of learners with varying levels of formal exposure to the TL were investigated using a cross-sectional research design. The IL of each group was regarded as a separate linguistic system. The changing feature of IL gives the impression that the IL is evolving towards the target norm. Since the Kikuyu learners at the same level were exposed to relatively the same L2 syntactic structures and they share a common L1, it is only natural that they use the same strategies for L2 acquisition and proceed along a similar developmental path.

The second issue emerging from these ideas is that deviations provide evidence of hypotheses formation and testing leading to construction of both target-like and NTL sentences. The existence of NTL sentences in the IL of Kikuyu learners of English was regarded as indicating the learners' creativity as they attempt to reconstruct English to express meanings.

Thirdly, the idea of the learners using specific strategies in their interlanguages shows that the L2 learners operate specific psycholinguistic processes and hence the reference to the idea of 'cognitive organiser' and 'creative constructor'. The explanation and description of the characteristics of the ILs of the four groups of learners used the proposed processes by Selinker (1969, 1972) in order to provide a rational explanation of how NTL sentences are formed. Error Analysis provided the methodology for the task of identifying the relevant structures.
Fourthly, the Interlanguage syntax of Kikuyu learners of English has distinct characteristics which are manifested in the ways they construct NTL sentences and the manner in which they formulate rules to generate novel constructions.
CHAPTER THREE

LITERATURE REVIEW

3.0 INTRODUCTION

The need to improve the quality of second language learning has been signalled in many studies. To deal with this, some researchers such as Krashen (1978, 1981a, 1981b, 1982, Corder (1967, 1981) and Fisiak (1981, ed) etc, have offered suggestions leading to solutions of major problems in language learning which are consistent with specific approaches and theories. The Contrastive Analysis hypothesis by Lado (1964) and its reappraisal by other researchers such as Sajaara (1978), Krzeszowski (1974), Corder (1967, 1981) and Selinker (1972) were all formulated to provide frameworks for conducting research aimed at providing insights into some specific aspects of second language learning such as the acquisition of L2 phonology, L2 syntax and vocabulary etc. Researchers and educators have used over the years the contributions of such studies to devise activities and programmes (such as the Notional Syllabus Wilkins (1976), Communicative Syllabus (Munby (1978) and Immersion Programme Krashen, (1978, 1981) etc, aimed at improving and enriching the quality of second language learning and teaching.

The following review of literature briefly evaluates the contributions and the underlying assumptions of the C. A. hypothesis, EA theory and the concept of interlanguage to SLA.
It examines representative studies which focus directly on the recent development in interlanguage framework and the Error Analysis methodology in order to lay the groundwork for investigating the interlanguage syntax of Kikuyu learners of English.

3.1 CONTRASTIVE ANALYSIS

Having elaborated the theoretical framework to be used in this study, it is necessary to examine same representative studies in second language acquisition which are relevant to research in Interlanguage syntax. The purpose of doing this is to show the recent trend in SLA research generally and specifically to Interlanguage syntax by discussing their contributions and relating them to major theoretical approaches.

Initial studies in SLA advocated CA approach to the solution of L2 learners' problem. SLA studies which were conducted within the CA frameworks benefited the structural comparison of different languages as it is evident in works produced by for example Agard and Di Pietro (1965b), Fisiak (1971), Stockwell, Bowen and Martin (1965) and Lehtonen and Sajavaara (1977). Proponents of CA assumed that it was possible to compare and contrast the system of one language with the system of another in order to predict the areas of difficulties. In the CA hypothesis the notion of interference was seen to account for negative transfer. By focusing on points of contrast between the L1 and the TL, it was argued, it was possible to predict the patterns of difficulties in (SLL). Explaining the rationale of CA hypothesis, Wardhaugh (1970)
points out that CA exists in a strong and a weak version. The strong version embraces a claim of the predictive power. The strong claim of CA suggests that language difficulties in the learning of an L2 can be predicted by comparing the structural properties of two languages before actual learning situation is observed. Recent studies, Odlin (1989), Richards (1974), Ellis (1985), Corder (1967) and Dulay and Burt (1972) as we intend to show later, have disputed this claim.

The weak version of the CA hypothesis according to Wardhaugh (1970:11-18) claims that the purpose of CA is to account for observed L2 errors by starting with empirical classroom data. The observed differences between the two linguistic system are then used to explain the origin and nature of errors in L2. As can be seen from this claim, the weak version of CA is concerned with the explanations of already discovered deviations and can be used to account for errors in SLL. This version of CA hypothesis has been incorporated in a wider study in EA.

The assumptions and value of CA in resolving problems in SLL were questioned by researchers like Sajavaara (1977), Fisiak (1981) and James (1971 1980), who questioned the theoretical base of CA especially in its strong version. They point out that the claim of predictive power is unrealistic and impractical. In its weak version, they argue, it has certain possibilities for usefulness and should be viewed as complementing E. A.
With the advent of generative grammar, CA was criticized because of its over pre-occupation with the surface structure of language (see Di Pietro (1968, 1971). Critics of CA questioned its methods and the underlying assumptions on the grounds of empirical validity and its lack of clearly defined theoretical foundations. Corder (1972) in particular claimed that CA was not compatible with generativists' view of language learning which postulates hypothesis testing. Dulay and Burt (1972) point out that CA is based on the behaviourists' conditioning principle which was no longer acceptable since its explanations are not plausible. CA fell out of favour as many L2 errors could not be predicted or explained as claimed. Researchers questioned the notion of transfer as explained in CA.

After the rejection of CA hypothesis and the subsequent abandonment of the behaviourists' theory of language learning, researchers revisited earlier studies of LI acquisition and the extent to which it is similar or different from L2 acquisition (cf Lenneberg (1967) McNeill (1966, 1970).

3.3 ERROR ANALYSIS AND INTERLANGUAGE

By studying the process of L1 acquisition the researchers hoped to build a picture of how L1 develops and compare this process with what is known in L2 acquisition. Studies which emerged from these investigation (e.g. Ervin Tripp (1974), Rosansky, Schumnan and Concino (1974) were unanimous in asserting that SLA like the first language acquisition follow similar stages "the universal route" and are
influenced by such factors as age, context of learning and the LI background of the learner. Reports by Ervin Tripp (1973) in particular was emphatic in pointing out that,

"in broad outlines, the conclusion is tenable that the first and second language learning is similar in natural situation in all second language learning we find the same processes: overgeneralization, production, simplification, loss of sentence medial items, etc."

Ervin Tripp (1973, in Hatch 1978:205)

Chomsky (1965) reasserted the biological pre-requisite in language development within the mentalistic framework by stating that the source of learners constraints on SLA is the same as the source that is believed to constrain L1 acquisition. The cognitive approach was favoured by transformational linguist as it provided psycholinguistic explanation to the process of language transfer and causes of errors in SLA as it emphasised hypotheses formation as well as experimentation while providing important feedback to the learner.

Among the first researchers to support the new orientation and give a new interpretation to the role of errors in SLA were Corder (1978b), Taylor (1975) and Wode (1976) etc. Learner’s errors are seen in terms of TL formulation and should be viewed as a violation of the rule. Corder (181:17) explains and illustrates in the following diagram that the language of a second language learner is a dialect which is he identifies as idiosyncratic dialect or transitional dialect.
Selinker as we intend to explain later proposed the term interlanguage to refer to idiosyncratic dialects. The following diagram illustrates the formation of interlanguage.

According to Corder (1967, 1978 and 1981) L2 errors should be considered as a natural phenomenon that must occur when learning a first or a second language before correct grammatical rules are internalized. Corder proposes that the concept of interference should be reframed as "intercession". Sridhar (1975) suggests that interference should be viewed as a learner strategy.
This suggestion gave a new perspective to the notion of transfer. Meisel (1980) proposed that language transfer should be seen as a psycholinguistic process. Corder (1981) makes the distinction between 'mistakes' and 'errors' by pointing out that mistakes are errors of performance and are unstable and unsystematic. Mistakes, according to Corder are of little significance to the learning process. Errors which he describes as 'errors of competence' are stable and systematic. They show the learners' underlying knowledge of the TL. Corder's distinction between errors of performance (mistakes) and errors of competence (errors) or deviations is significant as it provides a methodological framework for the study of learner errors. Kachru (1983) concurs with Corder's distinction between errors of performance (mistakes) and errors of competence but prefers to use the terms mistakes and deviations respectively.

In another authoritative work, Corder (1981) explains that the spontaneous speech of a second language learner has its own grammar and should be treated as a separate language which is identified elsewhere as idiosyncratic dialect. Corder distinguishes the language of an L2 learner from both the social dialect (sociolect) and the idiolect. Idiosyncratic dialect, according to Corder, evolves during the language acquisition. He points out that sentences containing errors are characterised by 'systematic deviancy' and they provide the learner with a means of forming and testing their hypotheses about the nature of the TL. Corder further explains that interlanguage should be viewed as "a series of interlocking system" which he describes elsewhere as 'the learner's built-in syllabus' (i.e. the interlanguage continuum), (see Ellis (1985:470. Nemser (1971d)
supports Corder's suggestion but prefers to use the term "approximative system" to describe the learner's transitional competence. He defines the term "approximative system" as 'a cohesive linguistic system' that is distinct from both the source language (SL) and the TL. According to Nemser, 1971(a), the approximative system of a second language learner follows systematic stages in its development. Fisiak (1981) argues that the study of learner errors alone is inadequate and reiterates that it is the entire linguistic system of the L2 learner that should be investigated (cf Fisiak 1981:45).

The most ambitious attempt to characterise learner language was made by L. Selinker (1972). He used the term interlanguage to describe the learner language. This term was similar to Nemser's (1971) approximative system and Corder's (1967) transitional competence. The term interlanguage as proposed and used by Selinker is popular among SLA researchers. Although the term approximative system, transitional competence and interlanguage are related, they represent different areas of emphasis in the way they conceptualize the learner language and the process second language learning.

According to Ellis (1985) interlanguage refers to the structured linguistic system which the learner constructs at any given stage in its development, Ellis (1985:47). In his attempt to elaborate the characteristics of interlanguage (IL), Bourke (1988, 1989) explains that,

"Interlanguage (i.e. learner language) is characterised not by well-formed target-like structures but by idiosyncratic forms which are erroneous to the native speaker, yet systematic from the L2 learner's point of view".

(Bourke 1989:20)

Selinker (1972) identifies and explicates five cognitive process that are
central in IL. These processes are outlined in Ellis (1985:47) and Richards (1974:37) as;

(i) Language transfer due to crosslinguistic influences (cf Odlin (1989).
(ii) Transfer of training as a result of faulty teaching procedure and inappropriate teaching resources.
(iii) Strategy of second language learning
(iv) Strategy of second language communication
(v) Overgeneralization of TL rules.

Selinker points out that many second language learners fail to attain TL competence because of fossilization. Fossilization is characterized by the occurrence of permanent incorrect linguistic features which an L2 learner retains in his L2 performance relative to his L1, despite exposure to TL through naturalistic acquisition or tutored second language learning. Fossilized structures are realized as errors which cannot be corrected through teaching because their internalized rule system contains rules which are different from either the SL or the TL.

3.4 LANGUAGE TRANSFER

According to Selinker (1969, 1972) language transfer involves the occurrence of fossilizable linguistic items and rules in the language performance of an L2 learner as a result of NL. This suggestion is supported by for example Meisel and others (1981), Keller - Cohen (1979) and Kellerman (1977) etc. who have shown in their studies that L2 learners' perception of the L2 are based on the previous knowledge of L1 structures. Although most studies are
unanimous that transfer plays an important role in L2 pronunciation, (cf Krzeszowski (1976) Dulay and Burt (1974b) and Fisiak (1981:75-76) there are still some unresolved issues on the extent to which transfer is a major factor in the acquisition of L2 syntax. Scholars for example Lo Coco (1975), Meisel, Clahsen and Pieneman (1981) point out that transfer of word order by Italian and Spanish learners of German was evident. Although Wode (1979), Schumann (1979) and Stauble (1984) supports the view that transfer is evident in the acquisition of negation, they argue that universal language processing strategies also play a major part in the acquisition of negation. Hylstenstam (1977) investigated the acquisition of negation among Swedish learners and concluded that word order errors in pro-verbal negation in main clauses and post-verbal negation in subordinate clauses showed that transfer was prevalent. He observed a developmental sequence in the acquisition of negation as it was evident that mastery of negation in subordinate clauses means implied mastery of negation in main clauses.

Studies by Dulay and Burt (1974a), Ravem (1974), Richards (1971). Bailey, Madden and Krashen (1974) have shown that errors made by L2 learners are developmental and transfer plays minimal part, what emerges from these studies is that transfer plays a major part in the acquisition of word order, relative clauses, negation, interrogatives etc. and it is accompanied by other processes which show hints of typological and universal influences at work.

3.5 TRANSFER OF TRAINING

According to Selinker (1969), another process that is central in IL performance is transfer of training as it contributes to erroneous constructions. In
her article, Stenson (1974:55) describes transfer of training errors as errors which come about as a result of course design or teaching techniques which leads to 'induced errors'. Errors resulting from transfer of training reveal little information about the learner's linguistic competence. They are worthy of study as they are invaluable in the accurate assessment of the learner's linguistic ability in the ESL. Some syntactic errors may occur in the II. performance as a result of internalization of faulty explanation and examples leading to misunderstanding or misrepresentation of meaning or usage. Richards (1974) points out that teaching techniques can produce transfer of training effects particularly where memory on the materials taught are apparent in reconstruction and retroactive inhibition.

It is also apparent in generalizations and analogy. Although it is possible to design materials which would minimize the unwanted effects of such factors, it is not possible to know whether it is advantageous to the learner. Such materials may have very little effect since there is no evidence that linguistic and instructional variable (i.e. the items we select to teach and the order and manner of presentation) conform with the psychological processes which lead to acquisition of linguistic competence (Stenson) 1974), and Richard (1974).

3.6 STRATEGY OF SECOND LANGUAGE LEARNING

Selinker (1969) suggests that fossilizable items and rules that are attributed to specific learning approaches by learners involve the strategies of second language learning. In this strategy, learners result to simplification of TL in order to perform a wide range of communicative and expressive functions. Simplification, according to Wardhaugh (1968:56-60) involves reduction
and modification of morphology and syntax as well as omission of function words, copulas and plural markers etc. to make the TL easier to use.

3.7 STRATEGY OF SECOND LANGUAGE COMMUNICATION

In this strategy, Selinker (1969) proposes that if the occurrence of fossilized items, rules and subsytems results from identifiable approach by the learner to communication with TL speakers, then we are dealing with strategies of second language communication. Faerch and Kasper (1983) define communication strategies as potentially conscious plans for solving what to an individual presents itself as a problem in reaching a particular communicative goal while Tarone, (1983) defines communication strategies as,

"a systematic attempt by the learner to express or decode meaning in target language in situations where the appropriate systematic target language rules have not been formed.

(in Faerch & Kasper 1983 : 5)

According to Tarone (1983), L2 learners employ distinct communication strategies in order to compensate for their limited knowledge of the TL in phonology, morphology, syntax and lexis. The most commonly used strategies according to Tarone include avoidance, paraphrase and transfer. Tarone points out that avoidance strategy is used in order to avoid making mistakes. This strategy involves topic avoidance and/or message abandonment as a result of inadequate mastery of the TL. Another strategy which L2 learners employ is paraphrase. In this strategy the learner employ their approximation, word coinage or circumlocution. In other instances the learner uses transfer strategy leading to calques (literal translation) or language switch.
They further point out that second language learner uses the strategies of transfer from L1, overelaboration, overgeneralization, avoidance, language switch, language mixing etc. as communication strategies in their interlanguage.

3.8 OVERGENERALIZATION OF TARGET LANGUAGE RULES

There are some errors which appear in the learners L1 performance as a result of the application of a rule of the TL to inappropriate TL form or context, resulting to overgeneralization, Richard (1971). In this strategy learners apply a newly learnt rule inappropriately in a sentence construction, for example, the interrogative word order with subject-verb-inversion is generalized into a statement. Overgeneralization differs from transfer from NL because the rules of TL are used in place of the correct TL rule in overgeneralization whereas in transfer the learner uses NL rules instead of the correct TL rules. Tarone, Cohen and Dumas (1976:76-90).

3.9 SIGNIFICANT APPROACHES IN SLA RESEARCH

Several of these approaches which we review here are relevant in this study and we propose to discuss them briefly:

   (a) The Acquisition learning Hypothesis in which Krashen makes the distinction between acquisition and learning. Ellis (1985) re-affirms this distinction and explains that acquisition is a 
       "process of internalizing new L2 knowledge ...........
       Acquisition occurs subconsciously as a result of participating in natural communication where the focus is meaning ........... Learning occurs as a result of conscious study of formal properties of language."
       Ellis (1985 : 26)

   (b) In the Natural Order Hypothesis, Krashen (1977) reaffirms that the acquisition of grammatical structures takes place in a predictable order. This hypothesis is consistent with the findings by Dulay and Burt's (1974) assertion that L2 like L1 is guided by universal cognitive mechanisms. They proposed the Creative Construction Hypothesis which we have already elaborated in the theoretical framework of this study.

   (c) The Monitor Hypothesis is concerned with the way in which learners edit and modify their language during performance. The Monitor according to Krashen requires three conditions namely; focus on form and not meaning, knowledge of rules and sufficient time.
The hypothesis is similar to Corder's Hypothesis Formation and testing.

(d) The Input Hypothesis states that acquisition takes place as a result of exposure to comprehensible input. Karshen (1985) explains that receptive skills of listening or reading play a major part in the learning process. His hypothesis has been extended to include Output Hypothesis by Swain (1985). Swain criticises Krashen's Input Hypothesis by pointing out that language output is potentially important as it focuses on the productive use of language use. She argues that it serves two learning functions that Krashen's Comprehensible Input does not address. Firstly, learners do not need knowledge of grammatical analysis to understand messages (input). It is possible for them to understand message by knowing the meaning of words. But, productive language use (output) requires explicit knowledge of linguistic rules (grammatical and communicative competence). Output compels the second language learner to focus on form of the message. Secondly, learners are able to test the hypotheses about the TL as well as receive corrective feedback.

(e) The Affective Filter Hypothesis focus on factors that are relevant in SLA. Krashen outlines these factors as motivation, self-confidence and anxiety. He stresses that the affective filter influences the rate of language development without affecting the 'route'.
The Affective Filter incorporates the notion of creative construction as proposed by Dulay & Burt (1977). Krashen points out in his model that some of the causative variable in SLA such as aptitude, role of L1, individual differences, age, routines and patterns play an important role in the acquisition of second language competence.

(ii) Schumann and Stauble's Acculturation Model (1978) was evolved with the premise that,

"SLA is just one aspect of acculturation and the degree to which a learner acculturates to the TL group will control the degree to which he acquires the second language."

Schumann (1978:34)

Acculturation has been defined by Brown (1980a:12) as the process of becoming adapted to a new culture. In Acculturation SLA is considered as a process which is determined by the degree of social and psychological distance between the learner and the TL culture, Ellis (1985). According to Schumann (1978) social and psychological distance influence SLA as they determine the amount of contact with TL. Schumann suggests that SLA is characterised by processes that lead to the formation of pidgin languages. He explains that when the social psychological distance is great the learner does not make any meaningful progress in the acquisition of TL and this results to pidgin. He refers to the process as the Pidginization Hypothesis. The acculturation model is closely related to the Cognitive Interactionalist Model which was proposed by Andersen (1981, 1983).
Andersen investigated the acquisition of English by Spanish students and concluded that there are certain.

"cognitive operating principles which govern the path the learner takes in developing an increasing more native-like and more efficient and successful competence in second language"

(TESOL Quarterly, 1990, 1992)

(iii) Giles and Byrne's Accommodation Theory operates within the social-psychological framework (Giles and Byrne 1982). It is concerned with the use of language as a reflection of social and psychological attitudes in inter-ethnic communication. It draws largely on the research by Lambert and Gardner (1971). Although the Accommodation Theory shares certain features with the Acculturation model by Schumman, it differs significantly in that Schumann explains the relationship in terms of variables depicting real social distance while Giles explains these relationship in terms of perceived social distance. Schumann views social and psychological distance as "absolute phenomena that determine the level of interaction between the learner and the native speakers", while Giles treats intergroup relationship as dynamic and "subject to constant negotiation during the course of interaction."

Ellis 1985 : 256

By considering the intergroup relationship as dynamic and constantly changing in the course if interaction, Giles takes into account the notion of variability in SLA.
The Discourse Theory is identified with Hatch (1978c, 1979d) and was developed with the premise that is elaborated in Cherry that,

"Through communicating with other people, children accomplish actions in the world and develop the rules of language structure and use"

Cherry, (1979:122)

In this theory, SLA is considered in terms of how the learner discovers the meaning potential of language by taking part in communication. Halliday (1975), shows that formal linguistic devices for realizing language functions develop as a result of interpersonal uses to which language is put. The theory focuses on speech acts and conversational strategies as means of developing second language. While Hatch is concerned with interaction and the process of discourse construction in SLA, it should be noted that the theory fails to address the question of learner strategies and the fundamentals of pragmatic rules of language use in context.

Variable Competence Model (Bialystok 1978, 1984), Ellis (1984a) draws on the work of Tarone (1982, 1983) and Widdowson (1979, 1984). In this Model, SLA is accounted for within the framework of language use and it proposes that the way a language is learnt is a reflection of the way it is used. The theory focuses on the process of language use and the product of language. The product of language use is explained by Ellis as "a continuum of discourse types" which takes either the form of
unplanned or planned discourse Ellis (1985:266). Widdowson (1984) elaborates that the process of language is concerned with the knowledge of linguistic rules and the ability to apply this knowledge. Ellis (1985:269) outlines the main features of the Variable Competence Model and states that SLA takes place as a result of participation by L2 learners in various types of discourse. This model considers the variability of interlanguage and the external and internal processes which are responsible for SLA.

(v) The Universal Hypothesis by Wode (1979) treats SLA as being determined by the nature of the linguistic rules that have to be acquired. Wode explains that the structure of the TL and the L1 determine the course of L2 development. The Universal Hypothesis borrows from the Chomsky's Theory of Universal Grammar and its treatment of language acquisition as a mental cognitive process. In the Universal Grammar, hypothesis formation is constrained by innate principles. Wode argues for a reconsideration and reappraisal of the theory of language transfer as an important factor in SLA. The Universal Hypothesis has been criticized due to its overly reliance on Chomsky's Universal Grammar which is based on innate faculty. The Universal Grammar operates on the assumption that linguistic knowledge is homogeneous. Ellis (1985), has pointed out that the main weakness of the Universal hypothesis is its inability to accommodate, "alternative explanations which may be equally valid. In particular it rules out the kind of pragmatic explanations offered by Halliday (1978)" (in Ellis 1985:210)
According to Halliday, linguistic universal are considered as;
"a manifestation of the types of use to which we put language while language development is a product of learning how to communicate in face-to-face interaction"
(Ellis 1985:210)

Chomsky's Universal Grammar has also been criticized for failing to address the primary function of language as an instrument of communication. Cook is quoted in Ellis (1985) as indicating that Chomsky's innateness theory sets up barriers against the real world because,

"Competence is separated from performance, grammatical competence from pragmatic competence, acquisition from development, core from peripheral grammar, each abstracting something away from language use,

(Ellis (1985:210)

Researchers are in agreement that Universal Grammar is accessible to L1 acquisition. Unfortunately, that question of availability of Universal Grammar to L2 learners is still a controversial one as major issues in this area are still unresolved.

3.10 METHODOLOGY OF ERROR ANALYSIS

In this section we review the existing relevant literature on the Error Analysis methodology due to its centrality in this study and describe how different studies have applied EA methodology. The methodology and procedure of Error Analysis is elaborated in Corder (1981) and outlined in Ellis (1985:51) as follows.

(i) A corpus of language is selected by determining the size of the sample, its homogeneity in respect to age, L1 background and level of L2 exposure.
The errors in the corpus are identified by comparing the non-target actual utterance of the learner with what a native speaker would have said to express the meaning.

The errors are classified by assigning a grammatical description to each error.

The errors are explained through identification of the psycholinguistic causes of errors by relating their origin to each of the five psycholinguistic processes proposed in Selinker (1972).

The errors are evaluated by assessing their impact on L2 learning in order to take principled teaching decisions.

The above procedure was used by Lennon P. (1991) who investigated longitudinally the acquisition of English syntactic competence by four adult German students in a naturalistic setting after an initial classroom exposure to English. Lennon suggests in his error identification that identification had to cover not just the erroneous form but the larger unit which had to be supplied so that the erroneous form is recognizable. Thus, for morphological error, the identity has to extend to the whole world, for prepositional choice error, over the prepositional phrase and as for errors involving the clause linkage, the sentence may constitute the domain, Lennon (1991:33).

The underlying principle in Lennon's error classification was to classify the errors in terms of distributional occurrence as opposed to psycholinguistic causes of errors. The application of this procedure facilitated the description of many different types of errors but failed to identify errors due to fossilization as a result of L1 interference. His study shows that errors in L2 persist despite many years of classroom instruction and ongoing exposure to the L2 target.
community. Errors frequency fluctuated in some aspects of English syntax as a result of increased exposure to the TL. Dulay and Burt (1973, 1974b) used a cross-sectional research design to investigate the acquisition of morphemes by Spanish and Chinese learners of English in a naturalistic setting. They used an expanded version of Bilingual Syntax Measure (BSM) which was developed by Brown (in Hatch 1978:350 - 351) as an instrument for collecting natural speech. The BSM was designed as an instrument for measuring the learner's acquisition of proficiency in English grammatical functors. The study which employed Error Analysis methodology provided evidence to support the view that L2 learners rely on second language learning strategies which are based on 'creative construction'.

According to Dulay and Burt (1973:251 - 256), creative construction, is,

"the process in which children gradually reconstruct rules for speech they hear, guided by universal innate mechanisms which cause them to formulate certain types of hypotheses about the language system being acquired until the mismatch between what they are exposed to and what they produce is resolved".

(in Hatch 1978:348)

They reiterated that L2 learners do not organize their L2 on the basis of L1 but rather rely on their ability to construct L2 as an independent system. The result of the study by Dulay and Burt are significant as they produced evidence to show that L2 errors are mainly developmental and transfer plays minimal part. Further studies were conducted by Felix (1981), Ellis 1984 a) and Schumann (1978 b) who separately used longitudinal research design to investigate whether tutored classroom and naturalistic SLA follow similar process. Their studies focused on the acquisition of negation, interrogatives and verb phrase morphemes among the German, Punjabi and Spanish learners of English.
respectively in the classroom setting. The evidence produced by their findings showed that tutored and naturalistic SLA follow identical processes. They demonstrate that the overall sequence of L2 development and the order of L2 development remains unaffected by formal instruction. Formal instruction in L2, according to Felix (1981), Ellis 1984 a) and Schumann 1984 b) influences L2 output leading to croslinguistic forms especially when learners are required to produces L2 structures which are beyond their competence.

The present study on the acquisition of syntax by Kikuyu learners of English continues the line of investigation initiated by Dulay and Burt (1974), Hatch (1974) and Bialystock (1985). However, whereas this study is similar to Lennon's (1991), Dulay and Burt's (1973), and Schumann's (1984) in design and in many procedures, it focuses on more aspects of English syntactic categories, uses larger and varied groups of ESL learners at four different levels of exposure to English, namely, Standard Seven, Standard Eight, Form One and Form Two with Standard Seven having the lowest formal exposure and Form Two having the highest level of formal exposure to English.

The instrument for eliciting data was based on the expanded Bilingual Syntax Measure (BSM) which was developed by R. Brown and used by Dulay and Burt. It differs from the one used by Dulay in its emphasis on the written production where the pictures used caused the learners to produce the target language that conveys their intended meaning.

This study diverges from Lennon's descriptive approach to L2 errors and adopts an interpretative approach whose underlying principle is to classify L2 deviations in terms of psycholinguistic origin as proposed by Selinker (1972) and adopted by Dulay and Burt (1974).
The reviewed literature in this study has been used as a guide since it offered invaluable contribution to the understanding of some of the insights and important issues concerning the theory and methodology of SLA research. Most of the insights, observations, conclusions and generalisations in these reviews were made on the basis of studies carried out in L2 learning settings which were dominated by native TL speakers as the main source of TL input.

The investigations in these studies were carried out among subjects who were socially and psychologically in contact with the native target language culture. Although this study applied and replicated some of the theories, methodology and postulations outlined in the literature review, it was designed differently in a number of ways.

(i) It used eclectic approaches derived from error analysis theory and interlanguage theory while taking on board the creative construction interpretation of the interlanguage continuum as well as the ideas in the Krashen's Hypotheses and Andersen's Cognitive Interactionist model.

(ii) It used a research instrument for eliciting interlanguage data from compositions which was based on a modified form of Roger Brown's Bilingual Syntax Measure (BSM) as well as manipulation grammatical judgements tests.

(iii) It used four large groups of learners with different English proficiency levels who had received TL input in the classroom setting from professionally trained non-native English teachers.

The ideas and information from the reviewed literature were used in the analysis of the data and discussion of findings in this study.
CHAPTER FOUR
RESEARCH DESIGN AND METHODS

4.0 INTRODUCTION
The present chapter is concerned with the description and explanation of the procedures which were used to elicit interlanguage syntactic data from a sample of four groups of Kikuyu learners of English as a second language who were placed in four different proficiency levels. It shows that the cross-sectional research design used a sample of 864 learners who comprised four different hierarchically placed groups of primary and secondary school learners of English. Each of the groups had been exposed to English in the classroom setting using a prescriptive graded ESL syllabus and relatively similar teaching and learning procedures. The research instrument consisted of grammatical judgement tests and composition production tasks suitable to each proficiency level. The data for the study came from the NTL syntactic constructions which were culled from the grammatical tests and the composition production tasks for our analysis.

4.1 SUBJECTS
A total of 864 learners of English as a second language who spoke the northern dialect of Kikuyu as a first language in Murang'a North and Nyeri districts served as the subjects in this study. It must be admitted that the choice of these subjects was determined by their ready availability in large numbers. The subjects in the two districts were drawn from ten primary schools and ten secondary school. At the upper primary school classes, a total of 400 subjects from both Standard Seven and Eight participated in this study while 464 subjects in Form One and Two in lower secondary classes participated in the study. The reason for the
selection of the twenty schools from the northern dialect was to allow the study to deal with a population whose linguistic background was relatively homogeneous as the speakers shared the same L1 and social cultural practices. The linguistic homogeneity was important since the study was trying to establish how the IL evolves among the L2 learners and the factors which contribute towards its development. The selected schools were therefore relatively similar in terms of linguistic composition, namely, predominantly speakers, of the northern Kikuyu dialect. In terms of geography, the schools shared the same locality at the eastern ridges of the Aberdares forest, and in terms of exposure to the TL, each group shared similar experiences as a prescriptive syllabus was used. The type of subjects selected thus provided a useful blend: sensitivity to both change and to established normative prescription in the teaching/learning situation.

There was a pedagogical and methodological justification for the selection of the four groups of learners from the same sociolinguistic background. The pedagogical justification was concerned with the relatively similar approaches and teaching techniques as well as learning resources that provided TL input to the learners at each proficiency level. Learners at each English proficiency level were assumed to apply relatively similar L2 learning processes of generalization, differentiation, simplification and regularization. Similarly they employed relatively similar communication strategies in their interlanguage production in order to overcome problems in communication.

The methodological justification is concerned with the operational procedures for the characterisation of the interlanguage syntax of Kikuyu learners of English as a succession of stages of proficiency approaching native-like competence in
the TL, as systematic, dynamic and permeable. The use of the four stratified groups of learners provided a framework for demonstrating the developmental aspect of IL by specifying how target input, internal mechanisms such as the creative construction process and interlanguage output are related. It was possible to describe the characteristics of IL independently without reference to the source language or the TL and demonstrate the capacity and potentiality of the creative processes of both reception and production.

Finally, the selection of the four groups of learners was significant for this study since it provided a mechanism for revealing the critical points of IL syntax development as they were assumed to be related to perceptual processing of TL input.

4.2 SAMPLING TECHNIQUE

The data collected was based on a sample of 864 learners of English from twenty schools. In selecting the twenty schools a total of 314 primary schools and 120 secondary schools from the northern dialect which is used in Othaya, Mukurwe-ini and Tetu of Nyeri district and Kangīma and Kīgumo division of Muranga districts was used. Stratified sampling in which the results of the end of 1994 mock examinations were used to identify the schools which participated in the study was used. According to each schools ranking on merit, three schools were selected from the upper bracket of the best schools, 3 from the average bracket and 4 from the lower bracket. By using this procedure a total of 10 primary schools and 10 secondary schools were identified to participate in the study. From each of the 10 primary schools, a total of 20 pupils in Standard Seven and Eight each were identified to participate in the study. The pupils were stratified into four brackets to ensure a representative sample of each class was selected.
The first bracket had the best 5 pupils selected, the second best had 5 pupils selected, while the third bracket, which was the average had 5 pupils selected. The fourth bracket which was the lowest had also 5 pupils selected. The teachers of English in each class assisted the researcher in the identification of five pupils in each bracket. The 1994 mock examination results and end of term examination results were used. The above procedure was used to identify the pupils to participate in the study in secondary schools' classes, Form One and Form Two. Although some classes were large there were few problems in sampling since the pupils had been ranked on merit. A major problem faced was that not all the pupils completed the research instrument in time. A few had problems with the instructions. To correct this problem, the pupils were allowed additional time to answer all the questions while those needing assistance in interpreting the rubric were guided.

Since the learners at each level were exposed to a graded prescriptive ESL syllabus which is hierarchically designed, the learners in Standard Seven were presumed to have lower English competence than their counterparts in Standard Eight. The learners in Form One and Two similarly represented two different levels of English competence with Form Two learners having higher English competence than their Form One counterparts.

All the 864 subjects represented four different levels of English competence which varied enormously according to the degree of formal exposure to the TL. Standard Seven had the lowest formal exposure to English as they had learnt English for seven years. Standard Eight subjects had been exposed to English for eight years while their counterparts in Form One had been exposed to English for nine years. The subjects in Form Two had the highest degree of
formal exposure as they had been exposed to English for ten years.

Each of the four groups of learners had received ESL instruction in the classroom setting using audiolingual and direct methods. They had practically no contact with native speakers of English as the subjects came from the rural area of Central Kenya.

Since it was important to present several examples of second language communication strategies of a particular group of subjects, only speakers of one dialect of Kikuyu were used.

All the subjects shared similar cultural and language background as Kikuyu is spoken as a first language. Each of the four groups of learners share relatively similar L2 experiences as a graded prescriptive English syllabus and textbooks were used. Since the subjects had the merit of youth and are exposed to varied language learning strategies and situations, their IL would be close to trends of change and thus throw light to emerging patterns of usage.

The four groups of learners in Standard Seven, standard Eight, Form One and Form Two were selected because:-

(i) The two upper primary school classes, namely Standard Seven and Eight, constitute an important stage in primary school education. Standard Eight marks the end of primary education as learners are expected to sit for the Kenya Certificate of Primary Education examination. English is one of the subjects in which candidates are expected to pass very well in order to win competitive vacancies in the limited high schools.

(ii) Learners in these two upper primary school classes receive intensive practice in English structure so that they are able to use English fluently
and proficiently and pass the Kenya Certificate of Primary Education Examination.

(iii) It is therefore understandable that the schools assign their best teachers of English to teach these crucial classes. Evidence of weakness in the performance ability by learners in English at these two levels indicates some major underlying linguistic, pedagogic and problems etc.

4.3 DATA BASE

The data base for this study was arrived at through the following elicitation techniques:

(a) Written production tasks consisting of 4 topics for composition writing. One composition topic suitable for each level was identified for each class as follows:-

(i) Topic for composition writing for Standard Seven:
Write a short story using the following sentence to begin your story.

"A cloud of smoke rose above the trees ......................"

(ii) Composition topic for Standard Eight: Write a composition beginning with these words :

"Suddenly, I was grabbed from behind ............."

(iii) Composition topic for Form One
Write a composition which should not exceed more than $2\frac{1}{2}$ pages and which begins with the following words.

"My father had always arrived home shortly after seven. This time he arrived earlier than usual wearing a completely furious face .............."

(iv) (a) Form Two composition topics: Write a composition entitled

MY FUTURE CAREER

OR

Write a composition which begins:

b) (i) "Pollution is not only destroying the environment, it is slowly killing us. The air we breathe is filled with harmful substances which are harmful to our health .............."

(ii) Study of the pictures in a sequence. One subject was required to give a narration in the past tense using the first person.

c) The third type of elicitation task consisted of a battery of grammatical discrete point item tests. It consisted of 235 items which were selected in the following order:

i) Standard Seven items were coded A with 45 items.

ii) Standard Eight items were coded B with 50 items

iii) Form One items were coded C with 60 items

iv) Form Two items were coded D with 80 items

The test items conformed with the objectives of teaching and testing English at each level as defined in the 1992 prescribed English syllabus for primary and secondary schools in Kenya, and approved by the Kenya Institute of Education.
The test items were based on the Generative Transformation Grammarians' view of language in which knowledge of the syntactic component is believed to enable the speakers to distinguish the grammatical sentences from the ungrammatical sentences. It is believed that it enables the speakers to identify sentences with identical structures. Knowledge of the syntactic component also enabled the learners to identify syntactically ambiguous sentences. Tests were therefore designed to demonstrate the existence or non-existence of these abilities among the learners and how they achieved communication in TL when there is inadequate mastery of L2 syntax.

The grammatical tests had items which tested the use of syntactic aspects of tenses, pronouns, negation, determiners, auxiliary, countable and uncountable forms of plural formation, word order patterning, interrogatives and relative clause constructions.

The grammatical tests and the composition tasks which were administered to the four groups of Kikuyu learners of English are presented in Appendix (iii). The tests covered a series of activities which included:

a) Choice from multiple choice items,
b) Filling the blanks.
c) Sentence correction and choosing the correct alternatives.
d) Sentence completion.
e) Sentence transformation.
f) Re-arranging jumbled words to produce a target-like sentence.
g) Re-formation of sentences.

In order to ascertain the reliability and validity of the instrument a pilot study was conducted in two separate schools six months before it was administered to the subjects. Those sections which were found to be unsuitable for the
particular target group were either modified or eliminated altogether. The instrument was refined and improved in order to elicit the requisite data. Besides testing the general competence in English the instrument was also used to reveal the relationship between TL competence, the frequency of NTL sentences and the processes in interlanguage formation.

4.4 **PROCEDURE**

Both the grammatical discrete item test (DIT) and the writing composition production tasks (CPT) were administered to the subjects in their respective classrooms where they normally carry out their studies.

The subjects were given ten minutes to read through all the sections and ensure that they understand the rubric in each section. Only a handful of subjects sought clarifications on the requirements of some sections. The subjects were given 1½ hours to answer all the questions. Although the tests were administered in conditions similar to those in regular examinations, the subjects were advised to seek guidance from the invigilators if and whenever they encountered difficulties in understanding the instructions. The subjects were allowed enough time to complete all the sections. The subjects were allowed thirty minutes break before the next test was administered.

After a thirty-minutes break, the composition writing tests were administered to all the subjects. The instructional procedure which was used in the administration of the grammatical tests was followed. The subjects were given 1½ hours to write their compositions. Those who were not able to complete their work were given enough time to complete their compositions.

The oral production test which was based on a short story was administered
in four classes in four separate schools after all the grammatical and written compositions were marked. The subjects in each class were issued with a series of pictures in a sequence which depicted an accident scene. They were given twenty minutes in which to study and discuss the pictures in class. One subject in Standard Seven class who was ranked in the middle position on the merit list was identified to tell the story in his class. The subject was advised to use past tense and the first person singular. The rest of the subjects participate in listening. The oral composition was recorded on tape in classroom situation. In the second school the same process was repeated with subjects in Standard Eight in the third school. A similar process was repeated with subjects in Form One. In another school the same process was repeated with subjects in Form Two. In all, four stories were recorded from four different classes in four schools. After listening to the natural speech of the subjects' four stories, it was evident that the spoken speech of the Standard Seven subject would be difficult to transcribe because it was not audible. Although the narratives of the Standard Eight and Form One subjects were audible and interesting, their interlanguage was relatively similar in the choice of syntactic and lexical items. There were instances where the non-target-like constructions and pronunciation difficulties as well as intonation patterns had similar features. The narrative elicited from the Form Two subject was selected because it was easy to listen to and it seemed to have the variety of target and non-target-like constructions which this study was designed to investigate. The text was transcribed and coded as text A.

4.5 IDENTIFICATION OF NTL SENTENCES

The responses elicited by the three different techniques were judged by trained teachers of English. As a starting point we used the revised system of
in four classes in four separate schools after all the grammatical and written marking English compositions and grammatical tests as contained in the East African Examinations Council guidelines (1976) and the marking procedure as explained in the Methods Handbook of Teaching Written English (1970) as authoritative guidelines for identification of NTL sentences and marking of English examination scripts in Kenya. These guidelines were taken as representative of familiar and widespread approach to the identification of NTL sentences and evaluation of the performance of learners in English.

The data elicited by the grammatical tests were marked for syntactic compliance in obligatory contexts. A group of trained teachers of English marked and rated the respondents responses as either,

(i) Correct for which the subject was awarded one point or

(ii) Incorrect for which no point was awarded

No mark was awarded for non-suppliance of an item. Each script was awarded a performance ability mark which was then converted into a percentage. Sentences which contained incorrect answers were extracted from the scripts and a list was compiled. The written compositions were marked and assessed in a mini-conference by a group of trained teachers. Samples of syntactically deviant sentences were recorded and a list was compiled.

The written compositions were marked and assessed in a mini-conference by a group of trained teachers. Samples of syntactically deviant sentences were recorded and a list was compiled. Each composition was rated and awarded a percentage performance mark. For the purpose of this study, a deviation was defined as any ill-formed sentences construction in terms of TL rules (grammatical and pragmatic). The study adopted Lennon's (1991 definition in which a deviation is defined as,

"a linguistic form, a combination of forms of an utterance which in the same context and under similar conditions of production would in all likelihood not be produced by the subjects' native speaker counterparts" - Lennon, (1991:32)
After marking all the grammar tests and composition tests from all the subjects in the twenty schools and awarding an appropriate proficiency mark, deviant and NTL sentences from all the schools were extracted and recorded. All the deviant constructions were categorized and described. It was evident that some schools had very few deviant and NTL like constructions as their level of English proficiency was considerably higher. Out of the twenty schools which had performed the tests, ten schools, five at the primary level with the highest number of NTL constructions and five from the secondary level with the highest number of NTL constructions were identified for description and analysis.

Deviant sentence constructions were identified in reference to the TL norms of Standard British English (SBE) and to some extent in terms of the emerging but not yet codified variety of Kenyan English.

This study adopted the criterion of identification of NTL sentences which was proposed by Johansen² who pointed out that the most important principle in identification of NTL sentences is comprehensibility of an utterance as this affects communication. By adopting this principle it became possible to distinguish the NTL syntactic constructions from the target constructions. This approach generated a corpus of 3225 NTL syntactic constructions from the composition production tasks for classification and analysis. The battery of grammatical discrete item tests generated 23,150 correct response and 37,348 incorrect responses out of a total of 42,120. There were many variables which could have contributed to non-suppliance of items or suppliance of incorrect items in the grammatical tests. These include for example, the internal structure of the questions and their presentation, comprehension of grammatical terms, interpretation of rubric and meaning conflict etc.

These tests focused mainly on the comprehension and recognition abilities by the subjects rather than the production abilities which focus on the subjects' creative abilities. The results of the subjects performance in the grammatical tests suggested something about what they do not know rather than about what they know about the TL. The responses from the grammatical tests were used to provide the researcher with the assessment of the subjects' proficiency ability in the TL.

All the syntactic NTL constructions which were identified were coded for classification. These NTL constructions which were generated from learners in Standard Seven and Standard Eight were coded P1, P2, P3 ...... etc. while those which were generated from learners in Form One and Form Two were coded S1, S2, S3 ...... etc. are presented in Appendix (i).

4.6 CLASSIFICATION OF SYNTACTIC NTL SENTENCES

A striking fact about the existing literature on the classification of deviations in second language learning is that different researchers have employed different criteria to the classification and description of deviations in L2.

In this regard teachers of English and examiners have applied non-linguistic criteria in the description of NTL sentences by L2 learners. Existing teaching manuals and examination marking guidelines which provide some information on the treatment of NTL sentences by L2 learners apply non-linguistic classifications. By referring to some aspects of target language learner deviations as deviations due to ordering, omission or selection such publications do not provide linguistic clues regarding the description of NTL.
Publications which use this scheme provide insufficient and unsystematic scheme of linguistic classification of NTL sentences. Although the classifications of deviant sentences which apply this scheme may be pedagogically acceptable since they provide limited information on the description of deviant sentences generally, they are unsuitable because they are inhibitive rather than facilitative. Such schemes do not take into account the linguistic interpretation and explanation of the origin of NTL sentences by L2 learners. In criticizing such description Corder (1981) emphasises that the description of deviations is a linguistic operation. He further points out that deviations should be described by the application of the linguistic theory. The system of classification of NTL sentences in the interlanguage of Kikuyu learners of English which this study adopted is both descriptive and interpretative.

The NTL sentences from each grammatical category were classified in terms of distributional occurrence and descriptiveness. Each NTL sentence was then assigned a psycholinguistic explanation of origin and a typological description of characteristics. The scheme of classification we employed was based on the modified system of classification of deviant sentences which was used by Lennon (1991:31-43). Lennon used it to classify deviant L2 sentences in terms of distributional occurrence without assigning psycholinguistic explanation indicating the origin of NTL sentences and deviant constructions. This system was favoured over others as it provided a rational framework of classification of deviant sentences. It enabled us to discover the rules the Kikuyu learners of English had used and hence provided us with a framework for making an informed generalizability. The data of 3225 deviant syntactic constructions were classified into the following ten syntactic categories:-
<table>
<thead>
<tr>
<th>D1</th>
<th>Deviations in Tense Use (DTU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>D2</td>
<td>Modals and Auxiliary Deviations (DMA)</td>

<td>Interrogative Clause Construction Deviations (ID)</td>
</tr>
</tbody>
</table>

Deviations which were derived from the same grammatical category were listed in the same group. In some sentences some constructions had deviations which were derived from different grammatical categories.

In the list which follow we list some examples of NTL constructions which were included in each of the ten syntactic categories. There are some NTL constructions which are listed in one grammatical category although they have deviations from other grammatical categories. In such cases only the grammatical category which is cited was analyzed and described. Although we focused on NTL constructions which displayed syntactic deviations from the ten grammatical categories for our discussion it is possible to identify lexical and semantic deviations for future research and discussion. In each of the ten syntactic categories we provide examples of the underlined NTL constructions. These examples formed the basis for the discussion of the nature, characteristics and
origins of NTL sentences and are numbered 1a, 2a, 3a, 4a, .... etc. while the
equivalent corrected ones which conform with TL rules are numbered 1b, 2b,
3b, 4b, 5b, ....... etc.

4.7 EXAMPLES OF NTL SENTENCES IN EACH SYNTACTIC
CATEGORY

D1 - Deviations in Tense use. In this category we included syntactic
deviations which reflected the use of NTL tense rules. Deviations which re­
lected the use of tense morphological rules were also included in this category.
The following examples illustrate some of the sentences in this category.

1a) Mwangi climbed. But when he approached to catch an orange that
branch break it down (Tenses and Article deviations). The correct
equivalent sentence is,

1b) Mwangi climbed the tree. But when he attempted to pick an orange, the
branch broke down.

2a) I decide to go near that smoke. I went straight without knowing where
it is. (Tenses and Negation Deviations).

2b I decided to go where the smoke came from. As I hurried towards it, I
could not see where it came from.

3a) The driver was not seeing him so he go over him and as the car go to
the other side of Karebe the people inside the car heard a person scream­
ing. (Tense, Adverbial Deviations)

3b) The driver did not see Mr. Karebe as he walked along the road. He ran
over him causing the car to swerve and crash. As the passengers
struggled to get out of the car, they heard a man screaming.
D2 - Modals and Auxiliary Deviations - In this category are syntactic deviations which illustrate how learners used expressions of ability and possibility in NTL sentences.

4a) He started screaming his friend as he would. In order to express ability in this sentence the correct sentence should have been;

4b) He screamed to his friend as loudly as he could.

5a) His sister was waiting for mangoes for she cannot be able to climb the tree

5b) His sister waited for the mangoes for she could not climb the tree.

D3 - Determiner Choice deviations - In this syntactic category are deviations which demonstrate the use of grammatical features which limit the meaning of the noun phrase. These are articles, demonstratives, possessives, qualifiers and numerals.

6a) When we went there we met two boys sitting near burning tree

6b) On arrival we saw two boys sitting on the burning tree

7a) Although these pollution play a great deal of destroying the environment .............

7b) Although pollution plays an important part in destroying the environment .............

D4 - Prepositional and Adverbial Particle Deviations - The deviations in this category demonstrate the L2 learners' use of prepositional locatives, demonstratives, etc., adverbial particles and adverbials in NTL constructions.

8a) He took him in the hospital

8b) He took him to the hospital
9a His father **when** he reached **there** and saw lying unconsciously .......
(also word order)

9b When his father arrived at the hospital he saw him lying unconsciously on the bench.

10a He was bleeding **at** the body

10b He was bleeding from the leg

11a He was late for the work **too much**

11b He was very late for work

**D5 - Clause Linkage Deviations** - In this category are clause constructions deviations which demonstrate how the learners used conjunctive elements in compound and complex sentences.

12a - Because he was **too late so** he was not **disturbing himself** to look **is** **there** a car coming

12b Because he was very late he crossed the road without checking whether there was any vehicle.

13a **When** he climbed the tree **and** he started to pick **and** he picked almost everything.

13b After climbing the tree he picked all the fruits.

**D6 - Relativization Deviations.** Listed in this category are deviations which demonstrate how the L2 learners used pronouns and relative pronouns in embedded constructions.

14a ............ when **he had** to **tell**, Mr. Karebe **he** was late and **he** was late and **he** rushed with **her** bicycle.

14b Since Mr. Karebe was late he used his bicycle to go to work.
Do not drink while driving a car because they might cause accident.

Do not drink when driving a car because you might cause an accident.

He was her wife going to school by a bicycle

He saw his wife going to school on a bicycle

When I saw that and I was eating I put them in the house and the others which are in the mouth I devoured them as quick as I could.

I was eating food when I saw what happened. I quickly swallowed what was in the mouth and then returned the remaining food in the house.

D7 - Deviations in Indirect Discourse and Word Order - In this category are listed syntactic deviations which demonstrate the learners' use of phrase structure rules in NTL sentences. Some of the NTL sentences contained sentence structure deviations which occurred in intranoun phrase post-modification. Such deviations affected the adverbials and participles in such sentences as:

He got broken his leg.

His leg was broken

The police told Mr. Karebe that if he had taken care this cannot happen.

The policemen informed Mr. Karebe that if he had taken care the accident could not have happened.

When my neighbours enter he asked what is the problem but because my mother could not be able to answer she keep quiet.

When my neighbours entered the house they asked what the problem was. But my mother was unable to answer. So, she kept quiet.

I am not your wife to abuse as you think.

I am not your wife. Stop insulting me.
D8 - Deviations in Agreement and Government - These are deviations which demonstrate the application of target language agreement concepts in singularity and plurality in nouns, pronouns and demonstratives in interlanguage syntax. Syntactic deviations in this category demonstrate verb use in concord relations.

22a The pedestrian were telling him to lowers the speed but he did not.
22b The pedestrian told him to reduce speed but he did not.
23a From that day on he losts the work.
23b From that day, he lost his job
24a One day a body and his father was digging the terraces for planting potatoes ..........
24b One day a father and his son were preparing their farm in order to plant some potatoes ...........
25a Mr. Kamau continue their work, but the man stayed near the big tree and they did not great him at all.
25b Mr. Kamau went on with his work while the man who did not greet him rested near the big tree.

D9 - Negation Deviations - In this category are included deviant syntactic sentences which demonstrate how the learners expressed negation. Although negation is expressed by not element there were other forms which learners could have used to express negation such as never, neither, hardly, few or little.
Sentences containing deviations in the use of negation also displayed additional deviations from other syntactic categories such as agreement, word order and tenses etc.

26a He coughed to attract his attention but did not heard.
26b He coughed to attract his attention, but he didn't hear.

27a The people started looking anything that not get burning and they did not see any except panga without handle.
27b The people looked for anything that was not destroyed by the fire without success. They only found a panga without a handle.

28a His father looked as if he was not how he was.
28b His father was disturbed

29a From that day, he have never took something or anything which do not no what it is.
29b From that day he has resisted taking strange objects.

30a And his aim was not to cause the accident. But if he did not drink alcohol he could have caused such an accident.
30b Although he drank alcohol, he did not deliberately cause the accident.

D10 Interrogative Clause Construction Deviations (ID) In this category are non-target-like constructions which illustrate learners expression of questions in reported discourse using the WH-interrogative clause constructions in for example;

(a) When the two children reach where the mango tree was they both started asking each other will climb the tree; instead of;
When the two children reached near the tree they decided who was to climb the tree

(b) Her sister came hurry and she asked Mutwa what are you doing.
   Instead of;
   Her sister hurried towards Mutwa and asked him what he was doing.

(c) When he saw ran to her and asked to them what wrong,
   Instead of;
   When he saw her running towards him, he asked her what was wrong.

This chapter presents the research design and methods. It describes the subjects, sampling techniques and outlines the data base. It provides an explanation of the elicitation procedure which was used in the administration of the research instrument, the approach which was followed in the identification of NTL constructions and how the deviant syntactic constructions were classified into the various syntactic categories. Examples of NTL sentences in each syntactic category are presented in this section. In the next chapter, we present the analysis of the data and findings in which we show that the performances of the four different groups of learners in our study in both English grammar tests and the composition tasks manifest varying interlanguages in which different NTL constructions were used.
5.0 INTRODUCTION

This chapter presents the results of the research findings in two phases. The first phase presents the results and analysis of the interlanguages of the four groups of learners. It focuses on the evaluation of the interlanguage syntax of each of the four groups of learners by examining the learners' performance in both grammatical tests and composition production tests. The comparison and assessment of the interlanguages of the four groups of learners was based on the learners' communicative ability, comprehensibility of their texts in the TL and the frequency and distribution of the NTL sentences in the interlanguage. The above criteria also influenced the grading of compositions and assessment of the learners' ability to produce target-like constructions which approximated the target norm.

Phase two presents the statistical distribution and frequency of the NTL sentences which were generated from the interlanguages of each of the four groups of learners. Sets of NTL sentences corresponding to Selinker's five central psycholinguistic processes were compared statistically in terms of their distributional significance in order to demonstrate the extent to which each of the four groups applied specific mechanisms such as generalisation, differentiation, simplification, and regularization in their interlanguages. It will also reveal how the learners structured and organised their ILs and used similar creative processes to achieve communication in TL.
INTERLANGUAGE PERFORMANCE OF L2 LEARNERS IN BOTH COMPOSITION TESTS AND GRAMMAR TESTS

Table 1 shows the mean score and standard deviations of each group of learners. The table shows that the highest mean score of 43.7 with a standard deviation of 8.46 was recorded among the learners in Standard Eight. The lowest mean score of 15.17 with a standard deviation of 3.96 was recorded among the learners in Form One.

82
The mean score of learners in Standard Seven was 31.84 while the standard deviation was 8.18. Form Two learners registered a mean score of 26.99 and a standard deviation of 5.67. The sharp differences in performance ability in the learners' interlanguages as revealed by the grammar tests was significant.

Standard Eight is a terminal class which marks the end of primary school education while Form One marks the beginning of secondary school education. Learners in Standard Eight were given intensive practice and exposure to English aimed at eradicating the idiosyncratic rules which lead to construction of NTL sentences. Therefore their interlanguage was considerably improved towards the target norm as deviations were minimal.

Table 2 shows the assessment of the interlanguage of the same groups in the compositions tests. The highest mean score of 49.9 was recorded among the learners in Form One while the lowest score of 26.19 was recorded among the learners in Standard Seven.

The mean score of the four groups as reflected in the composition test results show a marked progressive improvement of IL towards the target norm from a mean score of 26.19 in Standard Seven to a mean score of 37.8 in Standard Eight and to a mean score of 49.79 in Form One. The increasing trend declined in Form Two as the mean registered score was 45.7. Improved performance in IL towards the TL norm among the learners indicates that there was a marked reduction of NTL sentences among the learners in Form Two.

5.2 LEARNERS' PERFORMANCE IN ENGLISH GRAMMAR TESTS AND COMPOSITION TESTS

The statistical comparison of the performance results of the four groups of learners represent four different levels of English proficiency. The variety of English which was produced by each group of learners revealed similar characteristics in terms of the frequency and distribution of different types of syntactic deviations. There was some relationship between the distribution and frequency of different types of syntactic deviations and NTL constructions since they progressively decreased from the group of learners with the highest English proficiency and increased in the group of learners with the lowest English proficiency. This means that the interlanguage of learners in Form Two had few NTL constructions while the interlanguage of learners in Standard Seven had many NTL constructions. The higher the quality and quantity of formal exposure to the TL, the fewer the number of NTL construction in the IL of learners.

Table 3 displays the summary of the analysis of the combined variant mean scores of each of the four groups in both the grammar tests and the composition test results. The comparison in Figure 3 and Table 3 of the combined variant mean scores of both tests show that the IL performance of learners in Standard Seven, Standard Eight, Form One and Form Two as assessed had mean scores of 58.03, 87.5, 66.72 and 72.69 respectively. This translates into percentile interlanguage performances of 20.37% in Standard Seven, 30.71% in Standard Eight, 23.41% in Form One and 25.51% in Form Two.

FIGURE 3
REPRESENTATION OF LEARNERS' PERFORMANCE IN GRAMMAR AND COMPOSITION TESTS

Comparative Representation of the Relationship between Learners' Performance in English Grammar and Composition Tests

The diagram illustrates the mean scores of learners across different classes:

- **Std 7**: Group Mean Score 30.98
- **Std 8**: Group Mean Score 37.8
- **Form One**: Group Mean Score 43.7
- **Form Two**: Group Mean Score 49.79

Scores are represented as follows:

- **GT** — English Grammar Test
- **CT** — English Composition Test

The data shows an increase in mean scores from **Form One** (49.79) to **Form Two** (26.99), indicating improved performance in composition tests from the first to the second year of study.
Statistical comparison of the ILs of the four groups of learners was subsumed to reveal hierarchical relationship.

Although the interlanguage performance ability as reflected by the grammar test results shows a steady improvement of ILs towards the TL norm, there was a meteoric deterioration in Form One to a mean score of only 15.7. There was a slight improvement in IL performance towards the TL norm in Form Two where a mean score of 22.99 was recorded.

The findings from the analysis of IL performances show that there were significant differences in the ILs of the four groups of Kikuyu learners English relative to the degree of formal exposure to English. The ILs of the learners was changing and improving as it followed a predictable path, i.e. towards the target language norm. Progress towards the TL norm was not necessarily linear as there was evidence of backsliding as reflected in the interlanguage performance data of learners in Form One. Development in the acquisition of IL syntax towards the TL norm among four groups of learners was gradual and incremental.

The differences in the ILs of the four groups of Kikuyu learners of English became more pronounced when the analyses of the occurrence, distribution, frequency and origin of the different types of syntactic (NTL) sentences was examined in the next section; for example, according to these findings, we should anticipate more incidences of NTL sentences in Standard Seven which decreased progressively as the learners ascended to higher classes in Form Two.
Table 4 shows that the mean frequency of (NTL) sentences in the IL performance as reflected in the grammar tests in Standard Seven was 43.58 which represented 23.43%. The mean frequency of NTL sentences in Standard Eight was 40.85 which translated into a percentile frequency of 21.8%. Form One learners registered a mean frequency of NTL sentences of 33.79 which represented a total percentile frequency of 18.04%. The number of NTL sentences which were recorded in Form Two had a mean frequency of 68.75 which represented a percentile frequency of 36.7%. Table 4 illustrates the distribution of NTL sentences in the IL performance as reflected in the grammar tests and shows that there was a steady and progressive reduction of the number of NTL sentences from a mean frequency of 43.9 (23.43%) in Standard Seven to a mean frequency of 40.85 (21.8%) in Standard Eight and to a frequency mean of 33.79 (18.04%) in Form One. There was a dramatic increase in the number of NTL sentences in the IL performance as reflected in the grammar test in Form Two to a mean of 68.75 which represented a frequency mean of 36.7%. The increase in the number of NTL sentences as reflected in the grammar test in Form Two though unexpected was rather strange. The occurrence of target-like sentences and NTL sentences as reflected by the battery of grammar tests could have been influenced by a number of factors, namely;

Firstly, the nature and structure of the testing items in a syntactic category might have influenced how the learners perceived the sentences and made choices leading to production of both target-like and NTL sentences.

Secondly, the learners' comprehension and interpretation of the rubric might have influenced the learners' perception of the sentences.

Thirdly, non-linguistic factors such as non-suppliance of linguistic items such as guessing etc. could not have revealed the origin of both target-like and non-target-like sentences. Non-suppliance of a linguistic item did not reveal the grammatical competence of the learners.

The tests in grammar focused more on the comprehension and recognition skills rather than the learners' production skills and creative abilities. Despite the usefulness of the grammar tests in revealing the learners' IL performance ability and demonstrating differences in the ILs of the four groups of learners in this study, the interpretation of the origin of NTL sentences extracted from the grammar tests could not adequately reflect the nature and origin of NTL sentences. Regular suppliance and non-suppliance of both target-like and non-target-like features in specific linguistic contexts, and persistence of some deviations from a grammar test did not necessarily provide an account of how learners developed idiosyncratic sets of rules which lead to production of NTL sentences and other rules which lead to production of TL sentences.

Consequently, the NTL sentences from the composition tests were used to reveal;

(i) What the learners had internalised thus realising their competence in English

(ii) How the learners organised their Interlanguages and the rules they applied for the purpose of interlanguage communication.
(iii) The origin of NTL sentences, how they were formulated, the strategies the learners employed, their distribution and frequency among the four groups of learners.

(iv) The nature of L2 learners creative processes.

(v) Characteristics of the emerging interlanguages of L2 learners.

Differences in mean scores and assessment represent differences in the ILs of the four groups in Table 5 presents the distribution and frequency of NTL sentences from the composition tests in each of the ten selected syntactic categories. The table indicate that tenses had the highest distribution of NTL sentences which registered 30.4% while prepositional phrase and adverbials registered 19.7%. The distribution of NTL sentences in relativization was 12.01% while that of agreement and plural formation was 10.41%. Interrogatives had the lowest distribution of NTL sentences as it registered only 0.21%.

The statistical comparison of the distribution and frequency of NTL sentences from the transcribed oral narrative in Appendix (ii) with the distribution and frequency of NTL sentences from the written composition production tests show similar trends: For example, the Chart of the Distribution of the syntactic categories from the oral production task Table 6 shows that NTL sentences containing deviations in tense use, the use of proposition and adverbial particles, word order as well as modals and auxiliary deviations have the highest distribution of NTL sentences while NTL sentences with negation, interrogatives and plural formation deviations have the lowest distribution and frequency of NTL sentences.

Persistence of tense deviations such as *as I lied in bed/ I didn't thought/ and it came in and dealed with the thief*, from the Oral Production Task shows that L2 learners applied similar L2 tense rules to construct their sentences. They also used Tense Rulers in their IL which differed from those of the TL demonstratives in NTL constructions similar to; *and I knew this/ this was no joke/ and ---- this meant I had to face more challenges.* Learners further produced NTL constructions such as; *but it was so unlucky --------- they had superior weapons than mines ............... and it was able to aim the first bullet .............. etc.* in their language which did not conform with the TL norms. Occurrence of deviant constructions did not interfere with the listeners' comprehension of the narrator's message as it was accompanied by non-linguistic communication devices such as the use of facial gestures, hand movements, change of tone of voice and other body movements.

Prepositional phrase and Adverbials recorded 22.5% of NTL sentences while both Relativization and Word Order recorded 10% each of the NTL sentences. Interrogatives and Negation registered the lowest number of NTL sentences as each had a distribution of only 5%. An important difference between the NTL sentences from the written composition and the oral composition was found in the NTL sentences from the oral composition. The learner used repetition as a strategy of communication and as a discourse marker at least five times in the oral composition. The learner also used the avoidance communication strategy several times after giving up the attempt to convey the ideas he had planned to communicate in the oral composition.

5.4 STRATEGIES AND PROCESSES IN INTERLANGUAGE COMMUNICATION

Selinker (1972) proposed five psycholinguistic processes which were presumed to be responsible for the production of (NTL) sentences in the IL of L2 learners. In figure 4 on page 97 and Table 7 on page 98 we present a list of Selinker's five psycholinguistic processes and the distribution of NTL sentences in each process. The distribution of NTL sentences in the processes of:

(i) Language transfer,
(ii) Overgeneralization,
(iii) Transfer of training,
(iv) Strategy of learning and
(v) Strategy of communication shows that the main process in IL formation which was employed by Kikuyu learners of English was language transfer in which 72.93% of NTL sentences were recorded.

Overgeneralization contributed 8.085% of the NTL sentences while the strategy of learning contributed 7.34%. The strategy of communication contributed 11.62% NTL sentences. Table 7 and figure 5 on page 99 show that Kikuyu learners of English in Standard Seven had the highest distribution of NTL sentences which accounted for 32.98%. It also shows that this group of learners had the highest distribution of NTL sentences in the five psycholinguistic processes which was 36.89%.

</table>

The distribution and frequency of NTL sentences declined in Standard Eight to 26.36% while the occurrence of the NTL sentences among the five processes fell to 21.53% and their occurrence in the five psycholinguistic processes rose to 27.41% in Form One. There was a reduction in the distribution of NTL sentences to 18.06% while the occurrence of NTL sentences in the five processes in Form Two declined to 14.15%. This shows that the Kikuyu learners of English in Form Two registered few NTL sentences as their interlanguage progressively improved towards the target norm. The learners in Standard Seven utilised more of the five psycholinguistic processes and created more idiosyncratic sets of rules leading to production of NTL sentences. The comparison of the NTL sentences which were produced by the four groups of learners is graphically illustrated in figures 6, 7, 8, 9 on pages 101 and 102 it demonstrates that the
Interlanguages of the groups of L2 learners differed both quantitatively and qualitatively as the NTL sentences in the IL of each of the four groups of L2 learners varied enormously.

Syntactic Categories
In the illustration of psycholinguistic processes responsible for the formation of different NTL sentences which follow, we provide a sample of some NTL sentences which were produced by the different groups of L2 learners.

In this illustration, column one provides the psycholinguistic processes and strategies the learners are presumed to have used in their interlanguage syntax while the second column provides the syntactic categories in which the NTL sentences were classified. The NTL sentences and expressions in the third column represent examples of:

i) NTL expressions which were extracted from the Interlanguage of Kikuyu learners of English. These NTL sentences were underlined and marked with an asterisk.

ii) Equivalent target-like sentences and expressions which represent the correct target language which the learner needed to use in order to conform with target language rules.

By explaining the nature, characteristics and origin of the (NTL) sentences in the IL data of each of the four groups of Kikuyu learners of English, this study provided some insights into how the L2 learners apply TL rules in order to express their meaning and achieve communication in TL.

5.5 CONCLUSION

This section focused on the analysis of interlanguage performance of four groups of Kikuyu learners of English. It shows that there were significant differences in the interlanguages of the four group of L2 learners relative to the degree of exposure (as exemplified by their different syllabuses) and the period of exposure to the TL. The ILs of the four groups of learners varied both qualitatively and quantitatively according to the degree and period of formal exposure to TL input; for example Standard Seven learners had a shorter period of formal exposure to the target language than their counterparts in Form Two. Therefore, the Interlanguage of Standard Seven learners of English for example, had more NTL constructions than that of learners in Form Two who exhibited more target-like constructions as their interlanguage approximated the target language norm. Some of the NTL sentences in this illustration will feature in the discussion of findings in the next chapter.
Some of the NTL sentences in this illustration will feature in the discussion of findings in the next chapter.

By explaining the nature, characteristics and origin of the (NTL) sentences in the IL data of each of the four groups of Kikuyu learners of English, this study provided some insights into how the L2 learners apply TL rules in order to express their meaning and achieve communication in TL.

5.5 CONCLUSION

This section focused on the analysis of interlanguage performance of four groups of Kikuyu learners of English. It shows that there were significant differences in the interlanguages of the four group of L2 learners relative to the degree of exposure (as exemplified by their different syllabuses) and the period of exposure to the TL. The ILs of the four groups of learners varied both qualitatively and quantitatively according to the degree and period of formal exposure to TL input; for example Standard Seven learners had a shorter period of formal exposure to the target language than their counterparts in Form Two. Therefore, the Interlanguage of Standard Seven learners of English for example, had more NTL constructions than that of learners in Form Two who exhibited more target-like constructions as their interlanguage approximated the target language norm.
The analysis of NTL sentences in the ILs of Kikuyu learners of English shows that there was a progressive reduction of the distribution of NTL sentences among the four groups of learners. The learners in Standard Seven displayed the highest distribution of NTL sentences while the learners in Form Two had the lowest distribution of NTL sentences.

The comparison of the frequency of different types of syntactic NTL sentences with the cognitive creative processes and strategies which are believed to be active in interlanguage formation showed that language transfer, communication strategies and overgeneralization played a central role in the formation of interlanguage of Kikuyu learners of English. Learners used the L2 input data to draw inferences about the structure of target language and exploited their L1 linguistic environment as well as the creative processes to simplify, regularise and modify the L2 input leading to production of ILs in which some sentences did not conform with TL rules. The learners in Form Two used few IL processes and strategies which lead to production of NTL sentences in their IL.

In the next chapter, we discuss examples of specific NTL sentences in the interlanguages of the four groups of learners and how the learners selected, organised and restructured the L2 input data in order to convey meaningful message in interlanguage production.

The findings support the existence of universal processes and strategies which second language learners use in the production of their interlanguage (cf. Wode 1981, 1983) and confirms our general hypotheses.
The coincidence of our results with those obtained by other researchers such as Fathman (1975), Felix (1981) and Ellis (1985) in quite similar conditions also support the existence of universal principles in L2 learning.

An explanation of the origin and characteristics of NTL syntactic constructions which Kikuyu learners of English as a second language generate is discussed in this chapter.
CHAPTER SIX

DISCUSSION OF FINDINGS

60. INTRODUCTION

In this chapter, we discuss our findings in relation to the hypotheses tested and the two research question broached earlier in chapter one, namely;

(i) What were the strategies and processes that shaped the interlanguage syntax of Kikuyu learners of English?

(ii) Did increased formal exposure to English lead to the acquisition of target language which approximated the standard norm?

The statistical comparison of the different types of NTL sentences and their presumed origin according to Selinker (1972), indicated that the underlying processes in interlanguage formation such as language transfer, overgeneralization of TL rules, strategy of communication, transfer of training and the strategy of learning played an important part in the development of learners' interlanguage. It was found for example, that the dominant process in interlanguage formation was language transfer which accounted for 72.93% NTL sentences. Overgeneralisation of target language rules contributed 8.085% NTL sentences while the strategy of communication contributed 11.62% NTL sentences. Transfer of training contributed only 8.11% NTL sentences. These processes and strategies were found to be responsible for shaping the interlanguage syntax in our data as exemplified in the 30 NTL sentences which were cited in the examples in Chapter Five.
and many other NTL sentences that feature in this discussion. The data analysis in Chapter Five further indicates that out of the ten syntactic categories we identified in this study, namely the tense syntactic category, prepositional phrase and adverbial particles, modals and auxiliaries, plural formation and agreement, as well as of clause relativisation had the highest distribution and frequency of NTL constructions while interrogatives, negation, word order, determiners and conjunctive elements had the lowest distribution and frequency of NTL sentences. The following discussion of the production and characteristics of NTL sentences by Kikuyu learners of English in this study is examined and explained from two contrasting viewpoints, namely the interlingual viewpoint and intralingual viewpoint.

The intra-lingual viewpoint takes the perspective that the emergence of NTL sentences in L2 learning is attributed to the structure of the target language. This perspective presumes that there are specific inherent features associated with the internalization, interpretation and application of the TL rules by L2 learners and they manifest themselves as universal phenomena in the language learning process.

The second viewpoint takes the perspective that the emergence of NTL sentences among the Kikuyu learners of English (KLE) is attributable to the structure of the L1. According to this view, the emergence of NTL sentences of various syntactic categories is influenced by the differences between Kikuyu, the L1 of learners of English, and English, the target language.

6.1 OVERGENERALIZATION OF TARGET LANGUAGES RULES

The analysis of intra-lingual deviations in a corpus of production data in Chapter Five shows that NTL sentences attributable to overgeneralisation were
central in the formation of interlanguage syntax. In this process, the learners made incorrect generalizations of tense, plural, negation and word order rules within the TL in the production of their IL syntax. Learners with shorter period of exposure to TL (as indicated in our data in Chapter Five, Table Four and Five) in Standard Seven produced more NTL constructions attributable to overgeneralization than learners who had longer period of formal exposure to the TL in Form Two. As the learners acquired more rules and correct application as well as use of the TL through learning and instruction, their ILSs begun to include rules and structure which conformed with TL rules. The data in Chapter Five (Table 5) shows that 30.4% NTL sentences had tense deviations while 10.4% NTL sentences had agreement and plural formation deviations. NTL sentences containing word order and indirect discourse deviations were 4.53% sentences. The learners used some of TL tense, negation, plural formations and word order rules they had acquired during formal learning (as well as informal learning of English) to process and organize their IL syntax and achieve L2 communication. This led to production of NTL constructions as a result of overgeneralization, for example, learners had learnt that the tense time notions are realized in the morphological variations of the verb in English and that they are the most crucial constituents in the verbal group which show the morphological alternations marking one of the two types of tense. The learners had learnt that for example, the progressive aspect is morphologically realized as, be + ing while the progressive indicating that the action is complete (static) is morphologically realized as; have + participle, while the participle may have the morphemes -en, -ed and -t as: in broken, talked and learnt that the rules for the realization of past tense in the regular verb
which is achieved in the -ed morpheme and verb mutation in the irregular verb. Despite the rules the learners had learnt they produced the following NTL sentences.

31a I didn't saw an accident.
32a We started asked that what is happened.

The learners' production of NTL constructions 31a and 32a can be explained with recourse to Tense Hopping Rule. Our explanation is based on the concept that the L2 learners had learnt some TL rules for expressing either the continuous tense relations (although the sentences they produced were not correct in terms of TL norm). The learners had learnt that the past tense relation is expressed in the past tense in the main verb. The hypotheses and rules of Tense-Hopping the learners had formulated were incorrectly applied leading to production of sentences 31a and 32a.

Since the learners have the cognitive capacity to make hypotheses about the TL and employ specific strategies to achieve communication, they appear to have used two verbs in each of the two sentences 31a and 32a in the past tense leading to production of NTL sentences. The learners incorrectly formulated Tense Hopping rule since the correct rule does not derive the incorrect construction, the learners' processing and production skills were not fully developed for avoiding and preventing the extension of past tense in the second verb of each of the NTL sentences 31a and 32a. The learners appear to have applied past tense formation rule to the verb see and added the -ed morpheme to the verb ask in environments in which according to the learner
could logically apply, but unfortunately does not. The incorrect rule formulation and application derived the learner's utterances such as 31a and 32a as a result of Overgeneralisation of TL tense rules in tense formation. We might then expect them to produce NTL sentences until they have determined such things as where and when to avoid repetition of tense in for example, do-support constructions such as 31b and 32b

31b I didn't see an accident
32b We started asking what was happening

In another example, the IL syntax of Kikuyu learners of English shows that overgeneralization was also extended to constructions which use the non-progressive forms. The learners had learnt the rules for expressing the present progressive form for producing target-like construction such as;

I am writing a letter.

OR

I was reading a novel.

The learners extended this rule to state verbs leading to production of NTL constructions like:

33a The police are **suspecting** them of **having** one who killed my father.
34a He was **knowing** that **when he can meet the job had already started**
35a I was **thinking** that my mother **would gave him** food secretly.

The learners used state verbs as activity verbs. The meaning given by the semantic structure of these sentences suggest that the idea of something in
progress cannot be applied to them, and such other verbs as feel, see, smell and taste etc. The ideas expressed by the verbs, think, know, and suspect in these sentences are realised as state verbs and cannot be used in TL sentences with the progressive. Learners attempted to regularise their IL system by using the progressive form as if it was the only one obligatory in all contexts. Hence they avoided the simple forms,

e.g. (i) I thought that my mother would give him food secretly.
(ii) The police suspected that they had hidden the man who had killed my father.
(iii) He knew that he could do the job he had started.

Learners had extended the use of the progressive form to other state verbs like imagine, remember, hear and forget as a result of overgeneralization. This usage was familiar among the Kikuyu learners of English despite the fact that it is not acceptable in TL constructions.

Overgeneralization was also extended to constructions involving plural formation and singular usage leading to NTL construction similar to;

36a All the mens and womens was going there.

The learners had learnt the plural formation rule which indicates that the regular plural noun is realised by the additional of the \(-s\) morpheme to the singular in order to generate such words like boys, days, pens and books. According to Brown and Miller (1980) plural has been classified under the grammatical category of number. It is a feature of nouns and pronouns which affect the verb forms in sentence construction. The function of number deals with syntactic notions of countability and non-countability. Countable nouns can be realised as being either singular or plural.
Constructions using the regular plural are morphologically realised as -s or -es as in books and flies respectively. English has many nouns that do not conform to the rule of taking the -s and es morphemes and can be referred to as the irregular plural forms, and these are the rules the learners had learnt. In a grammatically correct sentence, the verb functionally agrees in form and number with the subject in the sentence. Some learners of English in this study formulated rules which did not restrict the use of the morpheme -s to the regular nouns but extended the rule to the irregular nouns leading to NTL constructions. The rules which generate the TL construction like, 36b All the men and women were going there.
did not conform with the production rules the learner had applied to produce the construction 36a.

Although our data did not reflect large numbers of NTL questions, there was evidence that some learners formulated questions which violated question formation rules as in the following example;

37a Did you went to school ?

The learners produced this NTL question as a result of overgeneralization Subject-Verb-Inversion rule. The Subject Auxiliary Inversion rule involves the process of copying and deletion. The correct rule derives the question like;

37b Did you go to school ?

and this is probably what the learners were taught. The learner incorrectly formulated Subject - Auxiliary-Inversion rule which he applied since the rule he created did not conform with the TL rules. The learner's rule copied the tense marker and any optional position but unfortunately failed to delete them.
from their initial post-subject position leading to auxiliary copying (Hutford, 1975). Hence the incorrect rule derives the learner's question 37a. The learners' application of the rule lacks one of the important operations which is available to the native speakers of the TL.

Negation is syntactically realized by the insertion of the particle not or its contracted form -n't. The learners had learnt that the syntactic paradigm for this negative marker is immediately after the first constituent structure in the auxiliary (Akmajian and Heny 1975:1). if there is no auxiliary, do or its forms, are introduced. Unfortunately, learners failed to apply this rule in their ILs leading to NTL negated construction like;

38a I didn't answered for him.
39a He didn't asked him any question.

The correct application of negative formation rule derives the sentences:
38b I didn't answer him.
39b He didn't ask him any questions.

There is observed consistency in the learners application of their "own tense and negation rules" which they extended to the second verb in each sentence leading to production of NTL sentences.

Kikuyu learners of English also formed rules and hypotheses governing the use of determiners, based probably on the explanations or the teaching they received from the classroom teachers. The sentences they produced were incongruous with the TL constructions. In the NTL sentence which follows, it is evident that the L2 learner had some knowledge about the use of the definite article the and had indeed produced many target-like sentences. The learner had learnt that the definite article the is used with nouns or objects in order to
particularize or specify them as in such construction as;

The house was destroyed by the fire.

But when the learners extended this rule to construction similar to,

40a The Maina's father took the boy and carry him,

a NTL sentence was formulated. The learner extended this rule to a construction in which a person is identified by name through overgeneralization. The determiner the was used in an inappropriate context and linguistic environment.

These findings in this study show that the distribution and frequency of NTL sentences attributable to preposition and adverbial particles was 19.7%. The data in Chapter Five also show that there was a decreasing mean frequency of NTL sentences from 357 in Standard Seven to 255 in Standard Eight and then to 144 in Forms One and Two. This represented a dramatic decrease of NTL constructions of 67.6% in Standard Seven to 32% in Form Two. The decrease is significant as it provided evidence that the period of formal exposure to the TL and the quality of exposure plays a major part in shaping the development of IL towards the TL norm.

The data in this study has many NTL sentences in which deviations in prepositions and adverbial particles have were produced; e.g.

41a He did not carried any item to which to work with.

Instead of;

41b He did not carry any item to work with

42a One day my father was gone early in the morning on garden

Instead of;
One day my father went early in the morning to the garden.

My father works on the Ministry of Works, instead of;

My father works at the Ministry of Works

As he was still on his journey he met with a car and the road was slope. Instead of,

As he continued on his journey he was met by the car which was driven along the steep part of the road.

The above four NTL sentences which were used by learners show that the learners interpreted and applied the rules they had learnt about the use of prepositions and adverbials differently from the TL norms. Robins (1964:227) explains that prepositions are invariable words which are distinguished by their syntactic function as they precede nouns to form groups that are substitutable for adverbs. In expressing the relational meaning, the preposition following the noun phrase does not function as a noun phrase, instead it functions like a special constituent identified as a prepositional phrase. Kikuyu learners who attempted to express the relational meaning conveyed by the prepositions produced NTL sentences. 41a, 42a, 43a and 44a, because they did not limit relational meaning to the situational and contextual meaning of the sentences: For example in 41a, the sentence needs an infinitive of purpose introduced (to+verb) in order to realise a construction which conforms with TL rules as illustrated in 41b. In 42a, the relational meaning expressed by the preposition to and the context of the situation is a general location rather than a surface. The same explanation can be extended to 43a, so that the preposition at expresses the appropriate relational meaning as in 43b instead of on in 43a. The compound NTL sentence 44a is introduced by the adverbial clause of time; As he was still..........................
The meaning conveyed by the whole sentence suggests that an activity verb should be used such as walked instead of the state verb was in order to relate the meaning with the (by-phrase) which follows in the sentence. Learners who have not been exposed widely to different situations, circumstances and uses in which prepositions are used to express relational meaning appropriately tend to over-use the familiar prepositions such as on, at in and to. They do so without consideration of the meaning attribute that the preposition may convey in the sentence as shown in 42a, 43a etc. Prepositions were used in many NTL constructions as the learners perceptions and interpretation of the relational meaning expressed by each of the prepositions did not correspond with the rules for generating TL constructions, possibly because they were not easily conceptualised. Dulay and Burt (1977) as well as Bailey, Madden and Krashen (1974) have argued that learners experience a highly consistent order of relative difficulties in the use of some functors across different language backgrounds. This suggestion implies that Kikuyu learners of English experience intra-lingual rather than interlingual difficulties as a result of inherent complexity of some English structures. Learners therefore extended the use of the preposition to in construction where at would have been appropriate, or they used the preposition in in a construction where the preposition into should have been used.

NTL constructions in which deviations in agreement and government occurred were relatively high among Standard Seven learners who registered the highest distribution of 32.7%. The distribution of NTL sentences with agreement and government deviations declined marginally to 21.2% among the learners in Standard Eight, Form One and Form Two. Although the
learners had learnt specific rules concerning the use of agreement and government, they produced NTL constructions which did not correspond with TL norms similar to:

45a The chemicals comes from different industries.

In 45a there is no concord between the plural subject, this chemicals and the plural verb comes as the rule which generates the grammatically correct construction dictates that subject must agree with verbs both in number and person so that the construction,

45b These chemicals come from different industries,

is deemed to conform to this rule.

The following two NTL sentences also illustrate the violation of agreement rules:

46a This villagers were told each other to go and look them once again, instead of the TL like construction,

46b These villagers were told to go and look for them once again.

47a This career is a good one since it have higher salaries

instead of the correct construction,

47b This career is a good one since it has a higher salary;

The IL of Kikuyu learners of English contains many NTL constructions which could be attributed to some underlying rules that the learners interpreted differently. Robins (1964:249) provides the viewpoint that agreement is, "the requirement that the form of two or more words of specific word classes that stand in specific syntactic relationship with one another shall also be characterized by the same pragmatically marked category or categories".

122
According to this view constituents of particular syntactic constructions must agree in respect to features of gender, number, case, person and tense.

Robin further explains that government is a feature that demands that, "a particular class in a given syntactic construction with another word of a particular class shall exhibit the form of a specific category".

In English, government applies to variable words such as pronouns where prepositions and certain verbs govern, "forms of the paradigm of pronouns according to their syntactic relations with them".

(Robin 1964:252)

In the examples,

(i) I waited for him,
(ii) He borrowed the book from me;

the syntactic relationship in government is established between the pronouns and the prepositions.

The concept of agreement is concerned with internalisation of syntactic rules which govern the operation of plurality and singularity. Lyons (1977), Brown and Miller (1980) classify plurality and singularity under the grammatical category of number. Number is a syntactic feature of noun classes which affect verb forms in sentences. The function of number deals with the semantic notion of countability and uncountability. Countable nouns are realised as being singular or plural. In a construction which conforms with TL rules, the verb functionally agrees in form and number with the subject of the sentence.

The IL of Kikuyu learners of English contained many different NTL constructions in which learners used their own concord rules which differed from those
of TL. The learners applied TL concord rules which differ from those for generating TL-like constructions.

Although this study did not address the strategy of communication as a separate entity from the five psycholinguistic processes, there was evidence to justify brief observations for future reference and study.

6.2 THE STRATEGY OF COMMUNICATION.

It was pointed out in Chapter Five that the strategy of communication contributed 11.62% NTL sentences.

Although the strategy of communication is related to the strategy of learning, it is appropriate that the strategy of communication is discussed separately. Communication strategies generally have been defined as devices employment by learners of L2 when they encounter problems in L2 communication because their communicative ends have outrun their communicative means (Corder (1983), Faerch & Kasper (1983), and Tarone (1977). It was noted in the previous sections that the IL syntax of Kikuyu learners of English was evolving towards the TL norm. In instances where the learners lacked the target syntactic structures for the purposes of expressing their meanings, they devised specific communication strategies in order to convey the intended messages. Avoidance has both cognitive and semantic manifestation as learners avoided whole topics when they felt linguistically unprepared for them. In some cases they abandoned the messages altogether. Syntactic avoidance took place when learners opted to use simpler syntactic structures that communicated adequate messages by way of presupposition for communication to go on. They produced NTL sentences in which avoidance of unfamiliar word was replaced with simpler and familiar word, for example, if less attention is paid
on the verb knock in.

48a His father knock it on the head and the snake dead.

The co-ordinating conjunction and has been used by the learner. When this sentence was reconstructed to produce a target-like construction, the co-ordinating conjunction was replaced by a subordinating conjunction until leading to this sentence with correctly tense applied rules,

48b His father knocked it on the head until the snake died.

In another example the learner avoided the negated modal auxiliary verb couldn't and used the negated auxiliary verb wasn't leading to this NTL sentence which had tense deviations:

49a She wasn't speak with anybody because she was feel as if his child had died,

instead of,

49b She couldn't speak to anybody because she thought that her son had died.

Another communicative strategy which was used by learners was paraphrase. In this strategy the learners rephrased their messages to make them understood. They employed any one of the three strategies in the construction of their sentences:

(a) Approximation: In this strategy the learner used a vocabulary item or a phrase which he knew was not accurate but which was similar in meaning to what he intended to communicate, for example,

50a The villagers did not get water that day as the waterpipe was broken.

(b) Word Coinage: The learner employed this strategy to make up a new
51a There is case that people who are sick airbone disease to be isolated from the health people.

The learner is sentence 51a meant patients with contagious disease. The sentence expressed what the learner wanted in unclear manner. To express the learner's intended message, the following construction was necessary;

51b In case patients infected with contagious diseases were admitted in the hospital, they should be isolated from the healthy people.

The creative potential of L2 learners made them coin words which would appear strange to native speakers of English. In the following NTL sentence, the negated word which we have underlined was used by the learner to convey the meaning of weakness according to the context of the sentence.

60a On the way he was filling so much unpoweful that he was unable to walk anymore.

The word feeling has been mis-spelt in sentence 60a, possibly due to phonological interference. The learner could have constructed a target-like sentence which could have conveyed the intended meaning similar to;

60b On the way, he felt so weak that he was unable to walk.

c. Circumlocution. In this strategy the learner described either an action or vocabulary item because he did not know the appropriate word leading to NTL sentences such as;

61a When the air is filled with things which are not health to our body many people get sick.
The embedded sentence in bold-face in 61a means **germs**. This sentence can be improved to read,

60b When the air is filled with germs many people get sick

(b) **Literal translation.** In this strategy, the learner translated Kikuyu word for word into target language leading to production of NTL sentences, like,

62a **Move outside these house!** The sentence in Kikuyu translation is:

(Uma nja!) Which means:

(61b **Get out of this house!**)

Literal translation was also extended to this sentence.

**6.3 INTERLINGUAL TRANSFER**

The viewpoint that interlingual transfer is responsible for the production of NTL sentences in L2 learning has received extensive investigation in many SLA studies (cf. Ellis (1985), Andersen (1984), Odlin (1989), Corder (1983) and Kellermann (1977) (1978). The findings in this investigation are in agreement with the postulations made in these studies as our data show in Chapter Five that the main process in interlanguage formation and development was language transfer in which language transfer related NTL sentences contributed 72.93% NTL sentences. The distribution and frequency of NTL sentences in Chapter five Table 6 among the four groups of learners show that the learners in Standard Seven who had the lowest period of English exposure in comparison with their counterparts in Form One and Form Four who had the longest period of exposure to English had the highest number of interlingual transfer based NTL sentences. Standard Seven learners had for example 579 NTL sentences compared to their counterparts' in Form Two who had only 148 NTL sentences. Table 6 also shows that NTL sentences with tense, auxiliaries (modals and primary), relative clauses, word order and agreement
deviations were dominant. The learners used the knowledge of their L1 grammatical structure and pragmatic rules of L1 discourse to organise the TL input leading to production of NTL syntactic constructions which were dis-similar from the TL norm. The learners used literal translation to construct the NTL sentences similar to:

63a. *I slept there down.*

This English NTL sentence is consistent with the Kikuyu word order pattern. The learner merely translated what he wanted to convey in English by imposing Kikuyu word order patterns. The construction conforms with Kikuyu word order pattern and it would appear correctly formulated when translated into Kikuyu, for example:

<table>
<thead>
<tr>
<th>I</th>
<th>slept</th>
<th>there</th>
<th>down</th>
</tr>
</thead>
<tbody>
<tr>
<td>ndakomire</td>
<td></td>
<td>o hau</td>
<td>thi</td>
</tr>
</tbody>
</table>

The correct TL word order rule should have generated the construction;

63b. *I slept down there*

in which the adverbial *there* is used as place adjunct relater.

In yet, another example, the learner produced the following NTL English sentence through literal translation.

64a *She was starting* crying because her sister *was saying* her brother was dead.

The equivalent TL English sentence which conforms with the indirect discourse rules should have generated the construction:

64b *She started crying because her sister was saying (that) her brother was dead*
The output data in this study has many examples in which the past tense verb, "started" has been used by the learners as a major feature for signalling the initiation of an utterance resulting to production of NTL constructions like:

65a  We started asked what are you doing
66a  I started asking why they were late

The past tense form of the verb start has been used in many instances as illustrated in NTL constructions 65a and 66a. The verb appears to be an important feature of the Interlanguage of Kikuyu learners of English as it is used in the initiation and organisation of IL discourse by learners who have internalised their L1 discourse rules where the equivalent Kikuyu verb which means started is an important feature. In the two examples, the learners used literal translation and transferred the L1 discourse rules in which the verb started has been used to signal discourse.

The learners who used the verb started to initiate discourse produced NTL constructions which had similar deviations as illustrated in example 66a and 65a.

In other instances, learners transferred the L1 discourse strategies to their developing IL as illustrated in the following examples.

67a  He could drove and drove always
68a  He shoot a gunshot
Repetition plays a major part in Kikuyu discourse. But when learners transfer Kikuyu discourse strategies into English through literal translation, the resultant NTL constructions similar to 68a and 69a were produced.

Such constructions are incomprehensive to native speakers who are not familiar with discourse features of Kikuyu. In order to understand the nature of the rules the learners had used such constructions as illustrated and translated should be examined from a literal translation viewpoint.

<table>
<thead>
<tr>
<th>He</th>
<th>could</th>
<th>drove</th>
<th>And</th>
<th>drove</th>
<th>always</th>
</tr>
</thead>
<tbody>
<tr>
<td>niahotire</td>
<td>gutwara</td>
<td>na</td>
<td></td>
<td>Agitwara</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>He</th>
<th>shoot</th>
<th>a gunshot</th>
</tr>
</thead>
<tbody>
<tr>
<td>Niarathire</td>
<td></td>
<td>na muchinga</td>
</tr>
</tbody>
</table>

NB: *Personal pronouns in Kikuyu are understood in context and L1 pragmatic rules of L1 use.

Whereas, the NTL sentences in these two constructions are meaningless in TL, their Kikuyu equivalent expressions are meaningful. Learners who transferred the Kikuyu discourse styles into English produced NTL sentences which were not recognisable as English but rather as translations of Kikuyu into English.

The data in Chapter Five shows that learners had extended the process of language transfer to the use of modals and auxiliaries which resulted to production of NTL constructions like:
In case one **can be able** to use a bicycle, one should use instead of a car. Instead of the sentence;

If one can ride a bicycle, one should use it instead of a car.

He promised his father he **will** not play with those animals that creeps on the ground

Instead of the equivalent TL like construction;

He promised his father that he would not play with those animals that creep on the ground

I **can** like farming as my career

Instead of,

I would like farming as my career

The above three NTL constructions show that learners were familiar with the rules of using modals and auxiliary verbs although they failed to apply them in constructing sentences which conformed with TL rules. In 69a, the learner appeared to know how to use the modal auxiliary verb **can**, but didn't know that **can** means **able to**. The two verbs should not appear in the same construction as it would lead to repetition.

In the NTL sentence 70a, the learner used the future auxiliary verb **will** instead of the past tense form. The context of the reported discourse dictates that the learner should have used the past tense auxiliary **would**.

In 71a the learner used the modal verb **can** instead of the verb **would**. The learner was not probably aware that the modal verb **can** is limited to **ability**, and hence inappropriate in this sentence. Translation of Kikuyu into English may have influenced the formulation of these sentences. Learners over-used the all too familiar modals which expressed the idea of **ability** and
possibility such as can and would. They avoided for example the modals which could have expressed obligation such as must, because Kikuyu makes very little distinction between the notions expressed by the modals ought and must.

Although learners had varied choices of modal verbs which they could have used to express ability, possibility, necessity, probability, permission and obligation, etc, such as can, could, may, might, will would, should, must, ought, etc. they avoided those which were not in familiar use despite their usefulness in conveying subtle meanings.

The use of modals in NTL constructions demonstrates that L2 learners had some ideas on how modals should be used in TL constructions but failed to apply these ideas to construct sentences which conformed with TL rules. It also shows that the rules that the learners had formulated about the meaning attribute of modals and how they should be used to express different shades of learning did not approximate those of TL norm. The learners avoided, for example the constructions that required modals which could have effectively expressed different shades of meaning and emotional colouring that is inherent in modal constructions especially in indirect speech acts; e.g.

(i) He could have smashed the snake to pieces
(ii) She must see the doctor tomorrow, and she will
(iii) How dare you enter my house?
(iv) You must apologise to your father

The use of modals in such constructions effectively conveys the message with the emotional colouring that is intended in the contextual meaning.
In some instances the learners' assumed that the modals are used in the same way as the auxiliary verbs. They applied the rules for the primary auxiliary verbs to the modals leading to construction of NTL sentences similar to;

72a  Her mother by this time could not know what was happening

Instead of the sentence,

72b  Her mother by that time did not know what was happening.

The construction of NTL sentence 72a in which the learners inappropriately used the modal verb instead of the primary auxiliary can be attributed to:

(i) the learners' first language or,

(ii) transfer of training in which the learners formulated and used TL rules on the basis of the procedures which were employed in the presentation of the TL. According to Selinker (op. cit) the TL instructional procedures the teacher adopts, presentation of learning materials, the way the textbook is structured and the context of language learning may lead learners to formulate hypotheses which lead to production of NTL constructions such as:

73a  He is drinks water quickly,

74a  He is walks daily,

The learner might have learnt through drill pattern practice how to transform the present tense constructions like,

73b  He drinks water quickly

74b  He walks daily
Conversion of 73b and 74b into the present tense would have produced the constructions:—

(i) He is drinking water quickly
(ii) He is walking daily

But the learners produced 73a and 74a. We would therefore expect the learners to produce NTL sentences through overgeneralization until they internalize the TL rules for generating the correct present continuous tense.

In another example in which the preposition at is used in a NTL construction, the learner had learnt that the verb reached means the same as arrived. He might have also learnt that at, as a locative preposition denotes a place or point and it follows such verbs as arrive or stay in construction similar to:

(i) They arrived at the stadium
(ii) They stayed at home

Since the learner had learnt that the verb arrived means the same as reached, he might have extended the use of the preposition at through overgeneralization to the verb reached resulting to NTL construction like 75a They reached at the stadium until they internalize the rules and limitation of the preposition to specific contexts.

The socio-cultural and linguistic contexts played a major part in shaping the interlanguage of the Kikuyu learners of English through the process of nativization. In this process the learners transferred and adapted cultural and
linguistic patterns of their L1 into English. Syntactic nativization occurred in constructions where learners had no exact English equivalent and this was manifested in many ways:

(i) Syntactic conversion occurred in constructions in which TL grammatical forms were transferred to a new grammatical category as illustrated in the following examples.

76a They tell her friend that they want to marry one girl who is neighbours our house

77a I will enjoy my life when I finished schooling

In 76a the word neighbour is used as a verb instead of a noun while the word school in 77a has been used as a verb in the same way as the word weed in 78a.

78a After that his father took the jembe and weed the shamba

(ii) The distribution of Kikuyu count and non-count nouns influences the production of NTL constructions similar to;

79a In Kimani garden there was so many fruits and all of them were ripe, in which the word fruit is used as a count plural noun.

Similarly, the word people is used as a count noun in the example;
The peoples took the bandage and those people

(iii) The non-occurrence of pro-nominal possessive forms in Kikuyu accounts for many non-target-like constructions similar to;

I choose this because I have been seeing people wearing works clothes

We went on with our chores in the kitchen and some of my sister were in my mothers room

(vi) Although reduplication is possible in Kikuyu discourse as it is used for emphasis it is not acceptable in English. However, learners transferred this usage into English resulting to NTL constructions similar to: -

They started their journey at the same speed. They flew and flew

When he climbed the tree and he started to pick and he picked almost everything

(v) Language transfer also takes place in speech functions such as proverbs, greetings, terms of endearment and forms of address. These contextual units function in the interlanguage of Kikuyu learners. Since language is embedded socioculturally, they differ from their counterparts in native varieties of English. Learners therefore produce constructions similar to;

When they came near Kamau's house they saw mother Kamau boasting herself outside with a chair

He kept his mouth semi-open and come to realised his mouth was seeing better than his eyes.

The Christian woman and the owner of the bush took the bottle of paraffin and waited for a car

Muthoni also laugh and tell Mathu that you do not forget you are in
danger

90a When I passed nearby a shop I meet a very old mother

91a They said the asking of my father's daughter and the threatening to dismiss him from the job was just joke.

In these constructions, Kikuyu meanings are transferred into English resulting to semantic extension as in 87a where semi-open is used instead of, wide open. Redefinition occurs in 91a in which my father's daughter is a kinship term used by a father to address his daughter.

Similarly 90a is also an exemplification of a translation of Kikuyu into English. The term mother is actually a kinship term of address among the users of the northern dialect and refers to all mature women and not necessarily one's immediate mother or grandmother. This term is also used with other expressions in greetings.

In the preceding sections, we have represented descriptions and analyses of some of the aspects of the form of the English which differentiates it from the standard form of English. We have shown how Kikuyu learners of English creatively reconstruct English according to the rules available to them and produce non-target-like constructions as legitimate constructions for expressing their meaning.

We have shown that English is a dynamic language which is constantly changing as a result of increased exposure. It is also undergoing lexical, semantic and syntactic nativization regularisation, simplification, and modification by Kikuyu users so that it can meet the socio-cultural and linguistic communicat-
In the discussion of the characteristics of the interlanguage syntax of Kikuyu learners of English and subsequent origin and nature of NTL constructions, we have shown that:

(i) Deviations were found to be highly concentrated in specific syntactic categories, and it appears that the advanced learners' main problems are with tenses, prepositional choice and the modal auxiliaries.

(ii) The Distribution and frequency of NTL construction fluctuated greatly among the four groups of learners and the trend is for deviations to be substantially reduced among the advanced learners in Form Two.

(iii) The processes and strategies which are linked to both intralingual and interlingual factors such as overgeneralization and language transfer predominantly shape the characteristics of the interlanguages of L2 learners.

(iv) The Interlanguage of Kikuyu learners of English is systematic, meaningful, comprehensible intelligible and dynamic in that the NTL constructions are understandable, predictable and interpretable and changing despite their deviancy.

The interlanguage of learners at the same level share similar characteristics as learners produce NTL constructions with similar features.
CHAPTER SEVEN

SUMMARY, CONCLUSIONS, IMPLICATIONS AND RECOMMENDATIONS

7.0 INTRODUCTION

This chapter summarises what has been done in this study, draws the relevant conclusions and makes some pertinent recommendations in accordance with the objectives of the study.

This study was designed to investigate the causes and nature of deviations in second language learning as well as the main characteristics of the interlanguage syntax of Kikuyu learners of English (KLE). Despite efforts that have been made to improve the quality of English learning and teaching based on existing research findings in SLA, major questions remain unanswered as result of persistence of NTL constructions and learners inability to attain native speaker competence in target language. There are also unresolved and controversial linguistic issues and research gaps which hamper implementation of some recommendations. This is particularly so in Kenya where some generalisations regarding L2 learner difficulties were made on the assumption that all L2 learners in Kenya experience similar linguistic difficulties. Existing language teaching materials were conceived on the assumption that L2 learners in Kenya constitute a homogenous linguistic group and it was assumed that they would experience similar L2 learning processes and strategies. The design of language teaching materials failed to recognise and reflect linguistic divergences of the indigenous languages and their influence in the learning and teaching of English.
Emerging studies, though few, show major linguistic differences in the indigenous languages which must be taken into account in the design of language teaching materials. Recent studies in SLA on factors influencing the acquisition of L2 in non-simultaneous language situations have generated much controversy about the nature and origin of deviations in second language learning. Some researchers have identified interlingual related factors such as transfer from L1 as contributing factors. Others have identified intralingual related factors and have referred to universal language learning processes and strategies such as generalisations and simplification. In view of these antagonistic standpoints, it is difficult to provide a better understanding of the factors shaping the characteristics of interlanguage syntax of Kikuyu learners of English.

The general aim of this study was to investigate the causes and nature of the syntactic deviations in the interlanguage of Kikuyu learners of English by achieving the following objectives:

(i) Identify, analyse and describe the syntactic deviations produced by Kikuyu learners of English.

(ii) Investigate the extent to which Kikuyu contributes to the formation of syntactic NTL constructions in the interlanguage of Kikuyu learners of English.

(iii) Examine the non-linguistic factors which may have influenced L2 generally and how they relate to the production of NTL sentences.
(iv) Provide some insights for better understanding of L1 and processes in the formation of NTL constructions.

(v) Propose recommendations and suggestions on how to ease the learning problems and alleviate the teaching/learning difficulties in the ESL.

In order to examine the interlanguage syntax of Kikuyu learners of English (KLE) and provide a rational explanation of the underlying factors in shaping the emerging interlanguage of L2 learners and construct specific profiles of characteristics of the interlanguage of Kikuyu learners of English, the following two hypotheses were considered.

(i) The processes and strategies which were adopted by Kikuyu L2 learners of English in the production of their interlanguage syntax led to the formation of an interlanguage which is distinguishable from that of TL.

(ii) The syntax of the IL of Kikuyu learners of English varies relative to the learners' degree of exposure to the TL.

In order to test the two hypotheses the following two questions were posed:

(i) To what extent did the learners' use of specific strategies and processes in their IL contribute to syntactic deviations?

(ii) Did increased exposure to English lead to acquisition of TL which approximates the standard norm in this study?
The written responses based on a battery of grammatical tests and composition production tests yielded 3225 non-target-like syntactic constructions from the composition production tests while the grammatical discrete test items generated 37,348 NTL responses and 23,150 target language-like responses. A total of 3225 deviant syntactic NTL sentences were coded, recorded and analysed.

The 3225 deviant syntactic NTL sentences were classified into ten syntactic categories. Quantification of deviations included frequencies and distribution of individual syntactic category. Each of these deviations were illustrated and discussed with examples from the data. The ten different syntactic categories were by no means exclusive. In some cases deviations from some categories overlapped.

7.1 SUMMARY OF FINDINGS

From the data analysis in Chapter Five and the corresponding discussion in Chapter Five, we were able to establish the following :-

(i) The responses from the four groups of Kikuyu learners of English (KLE) with different periods of exposure contained various types of NTL constructions which were classified into the following syntactic categories:

(a) Tense
(b) Modals and auxiliaries
(c) Determiners
(d) Prepositions and adverbial particles
(e) Clause Linkages
2. Deviations in tenses, modals and auxiliaries as well as prepositions and adverbial articles were dominant among the groups of respondents. Negation and Questions - formation contributed the lowest number of NTL constructions.

3. Kikuyu Learners of English (KLE) employed different processes and strategies in their interlanguage communication in the formulation of their NTL constructions in which the phenomena of language transfer, overgeneralisation and communication strategy influenced the production of NTL sentences.

4. The NTL sentences which were produced by the four groups of learners differed in category, frequency, distribution, quantity, quality, communicative ability, comprehensibility and intelligibility. The observed tendency was that of a general progressive decrease of NTL sentences made by learners from Standard Seven to Standard Eight, to Form One and to Form Two. Learners in Standard Seven and Eight had the highest distribution and frequency of NTL sentences; higher than those of their counterparts in Form One and Form Two.

5. There was some relationship between the frequency and distribution of the different NTL constructions and the psycholinguistic processes which are presumed to be responsible to IL formation. Learners in Standard
Seven with a lower period of formal exposure to English, hence low competence level in TL, used more LI related strategies and processes than their counterparts in Form Two who had longer period of formal exposure to English.

6. NTL sentences of different syntactic categories tended to decrease as a result of increased exposure to English in Form Two. However, there was no significant decrease of deviations in NTL sentences in tense use, preposition and adverbial particle deviations as their distribution and frequency remained relatively constant in relation to the other types of syntactic categories. Learners learning difficulties appeared to be centred in these syntactic categories.

7. There was a tendency for NTL sentences to decrease among the Form Two learners of English as their IL syntax approximated the TL norm due to increased and improved formal exposure to English through learning in comparison to the NTL sentences among the learners in Standard Seven who had limited exposure to English through formal learning.

8. The Interlanguages of the four groups of learners showed markedly different characteristics in such domains as similarity and regularity of NTL sentences among the members of each group, reliance on similar processes and strategies by each group and occurrence, distribution and frequency of more L1-like syntactic features among the learners with lower period of formal exposure to English.

9. The interlanguage of each group of KLE appeared to be rule-governed in that in instances where similar processes and strategies were used, such as language transfer or overgeneralization, the observed NTL
constructions followed similar rules and patterns. Such rules were predictable.

7.2 CONCLUSIONS

The conclusions which follow are drawn from the findings of the study as outlined above. The conclusions reached in the study include:

(i) All the learners in the four groups under study made various syntactic deviations which were manifested in their NTL constructions. The four groups made various types of syntactic deviations which were classified into ten syntactic categories. The learners' tendency to make syntactic deviations revealed that they relied on similar processes and strategies in their interlanguage. These strategies include language transfer, overgeneralisation, simplification and communication strategies. Such strategies were reflected in the ten syntactic categories. The four groups of learners therefore needed to improve their syntactic competence in order to produce target-language-like sentences.

(ii) Although the four group of learners in the study produced relatively similar syntactic deviations in their interlanguage, they differed in frequency, distribution and category. Deviations in some syntactic categories such as tenses, modals, auxiliaries, prepositions and adverbial particles remained relatively constant among the four groups. Deviations from other syntactic categories tended to be less frequent among the advanced learners in Form Two than among the less advanced in Standard Seven. Form Two learners were considered to be the most advanced learners as they had been exposed to formal learning and
teaching of English for a longer period than their counterparts in say Standard Seven, Eight and From One. Therefore the IL of the advanced group in Form Two seems to have fewer of the above deviations as compared to the IL of those with a less period of exposure to TL. It can therefore be concluded that the IL of the four groups of KLE is marked with significant decrease of syntactic deviations relative to the period of exposure to the TL.

(iii) The general tendency for the decrease of syntactic deviations relative to the period of exposure implies that the IL of learners at the advanced level approximated the TL norm. This shows that the learners syntactic competence increased from one level of learning to the next higher level as learners produced fewer NTL constructions.

(iv) Form Two learners with longer period of exposure to English tended to portray greater syntactic competence than Standard Seven learners who had a shorter period of exposure to English. The time spent in formal learning was therefore an important factor as it contributed to improved competence in English. These conclusions are in agreement and consistent with the observations made by Krashen and Seliger, Long and Fathman that formal instruction in L2 learning facilitates learning particularly in non-simultaneous acquisition poor environments. Non-simultaneous Acquisition poor environment refers to environments where the native speaker factor is absent and L2 learning is restricted to the formal language learning in the school. The period spent in formal learning and teaching of English was therefore a crucial factor in enhancing
syntactic competence as revealed by the reduction of the NTL constructions in Form Two.

Although some deviations in some syntactic categories showed progressive reduction among the four groups with Standard Seven learners showing the lowest reduction and Form Two learners showing the highest reduction of deviant constructions due to longer period of exposure, some syntactic deviations remained relatively high as all the four groups appeared to display similar distribution and frequency of NTL constructions. This showed that formal instruction does not always result to reduction of reliance on certain strategies and processes in second language communication. This observation could imply that there are other factors influencing the learners interlanguage in addition to formal learning and teaching. Some of the deviation as this study revealed are related to language transfer, paraphrase and simplification.

From the analysis of interlanguage related NTL constructions and the resultant findings, it can be concluded that L1 plays a major part in the formation of IL. The IL of the L2 learner is improved towards the TL norm as the period of exposure to TL is increased. The IL of Form Two learners had few NTL construction than that of Standard Seven learners who had more NTL constructions. Consequently, as the learners syntactic competence improved, the learners relied less on L1 related strategies. This observation confirms the findings of this study and is
in agreement with other researchers such as Dulay, Burt and Krashen who have pointed out that although L1 is an important influencing factor in L2 learning it is not a major factor in the learning of a second language.

As observed in (vi) First Language related NTL constructions had the highest frequency and distribution. Therefore, the L1 related deviations posed the greatest challenge as they were the most frequent among the learners in Standard Seven and Eight who had shorter period of exposure to TL. The relatively high frequency and distribution of L1 related NTL constructions showed that the learners under investigation had not mastered the rules of the grammar of English.

The analysis of all the deviations and NTL constructions among the four groups showed that the ILs of the four groups differed significantly. Therefore the ability of the four groups of learners to make correct syntactic choices in a given context differed significantly with the advanced learners making fewer deviations than the less advanced.

The study therefore found out that although the IL of the four groups of learners differed significantly, showing varying levels of syntactic competence, in some aspects of syntactic ability the performance of the four groups of learners was similar. Therefore some syntactic deviations
can be said to be more predominant than others in certain levels; others are common among all the four groups of learners under study. However, formal exposure was found to be an important factor as it facilitated learning and the consequent reduction of NTL constructions.

The findings confirms the hypothesis tested and provided answers to specific questions broached earlier in the introduction.

It was observed that the learners overcame their target language handicap by creating new words and expressions which were consistently with their L1. Some of the expressions resulted into word coinage, pidginization and translation.

They symbolised a distinct socio-cultural reality as they represented the evolution of a local and distinct variety of English. This emerging variety of English though uninvestigated departs from the established norms of Standard British English. Elaborating this phenomenon, Prator observes that, "They (the mother tongue type of English) have sprung from a common linguistic stock and have evolved at a relatively slow rate over the decades since they achieved their separate identities. Such changes as have occurred in them have been largely the result of little understood processes of internal evolution and have kept pace with other elements of social change; even after many years of semi-independent developments, these types of English are characterised by a high degree of intercomprehensibility especially as spoken by the well educated".

(Prator 1968 : 163)
It is easy to account for mutual intelligibility among the uses of the emerging variety of English as they share similar grammatical structures in their interlanguage.

7.3 **RECOMMENDATIONS**

Arising from the findings and conclusions of this study we make the following recommendations for the research in SLA generally, and the teaching and learning of English as a second language in Kenya.

I. In view of conclusion (i) that Kikuyu learners of English use specific processes and strategies in interlanguage communication and that these processes and strategies are responsible for the formation and production of NTL constructions, this study recommends that there is a need to improve the quality of teacher competence in language teaching. Improvement of teacher competence in English teaching should equip the teacher with pedagogical linguistic principles for guiding the learners to organize the TL input logically and sequentially in order to express themselves in grammatically correct English. Improved teacher competence should provide the teacher with skills and abilities to use the strategies and processes available to the learners for the production of TL constructions.

II Considering conclusion (ii) that some deviations in particular syntactic categories remained relatively constant among the four groups of learners, there is a need to re-examine the ways these syntactic structures are present in the textbooks and the methods of teaching.
Existing ESL syllabuses are designed to remove learner problems in advance by explaining difficult structures and providing grammatical points. Such syllabuses do not contribute to exploitation of learners' linguistic potential and communicative abilities since it is when learners encounter problems that they result in communicative strategies. English syllabus for L2 learners should be designed to pose problems and provide solutions as ways to deal with such problems of say expressing notions of progressives, modality and conditionals etc.

III Since conclusion (iii) shows that the increased quality exposure to TL leads to improved TL constructions and reduction of deviations, this study recommends the review of the sequencing of language items in the English syllabus. The existing English syllabus is based on the assumption that some English structures are simpler and therefore easier to learn than others. Syllabus designers and textbook writers who made this assumption did not base their notions of simplicity on SLA research but rather on their own intuitions about what was a simple structure and a complex structure. This study recommends that sequencing of language structures should be made according to the practical needs of the learners rather than according to the structural simplicity of teaching items.

IV As regards the fourth conclusion that increased and improved exposure to TL contributes enormously to the improvement of syntactic competence, this study recommends that L2 learners should be guided in extensive reading. Extensive reading exposes learners to correct
grammatical structures and use of these structures in specific contexts and situations.

V As regards the fifth and sixth conclusion that L2 learners at all levels rely on strategies and specific processes despite increased exposure to TL and that L1 plays a major part in the formation of TL, there is a need to equip the teachers of English with adequate analytic skills to enable them apply error analysis techniques in the teaching of L2.

VI This study recommends major review of the primary school and secondary school syllabuses of English. The review recommended in this study should focus on an approach that provides a rich grammatical and functional framework within which English has to be taught. Presently there is an overly reliance on the teaching of grammatical items and rules at the expense of use. An approach that recognises that language is an instrument for generating what learners want to say spontaneously and this largely depends on creative interaction in the classroom, should guarantee improved English competence. Our view is that such an approach seems to have greater pedagogical potential for the English language teacher as it would lead to reduced NTL constructions among the learners.

VII Teaching methodology plays a central role in the learning process. Bialystock (1985) point out that teaching learners to use strategies effectively could enable the learners to gain experiences in the use of
communication strategies, so that they can identify specific communication strategies which can be applied to a specific problem. Knowledge of the use of communication strategies is helpful in the early stages of L2 learning when learners have inadequate TL resources which they can use in their L2 communication (This study shows that L2 learners employ L2 communication strategies extensively). We are not proposing the abandonment of situational functional approaches since they are useful for mastery of language specific structure and expressions but we are advocating that they should be supplemented by for example introducing contextualized activities such as;

i) Making the sentences negative,
ii) Changing questions to statement,
ii Changing the present continuous to for example, the use of the expression, going to inorder to express the future,
iv Substituting personal pronouns for proper names,
v Deleting prepositional phrases and,
vi Deleting objects etc.

Such activities may use substitution, mutation, repetition and addition drills. These suggestions represent on step towards the alleviations of learning difficulties, reduction of NTL constructions and improvement of the quality of English language teaching and learning.

7.4 IMPLICATIONS FOR FURTHER STUDY

A major implication of this study is that problematic syntactic categories as cited in the study would prove practical and indeed helpful in
the design of language teaching materials as it would guide the adoption of practical strategies for improving the syntactic competence of L2 learners.

Another implication of the findings of this study is that developments in the field of theoretical syntax can be successfully exploited in the classroom. Particular reference can be made here to the field of syntactic theory, the approaches to the teaching of grammar (c.f. Allen J. P. B. 1974) and the techniques suggested by Cook V. J. in Allen and Campbell (1972).

Although the present study concentrated on interlanguage production, it recognizes that TL communication has two domains, namely; the production and the reception domains. The reception strategies which the L2 learners employ deserves attention. The reception strategies employed by L2 learners have significant implications for the improvement of listening comprehension and the interlanguage syntactic constructions which are produced by L2 learners. An investigation of the reception strategies would throw some light in the relationship between input and output in L2 learning and teaching.

This study looked only at the processes and strategies of interlanguage syntax as well as the period of exposure as major determinants of the patterns of interlanguage development. Teachers attitudes, too, in relation to focusing on grammatical correctness or comprehensibility, classroom techniques such as using grammatical drills may affect the strategies the learners employ and the types of syntactic deviations they produce. Such findings that specific learning environments (like the Kikuyu L1 background) produce particular tendencies of strategies and processes use would provide valuable insight into the improvement of the methodology of L2 teaching.
Finally, future research should focus on the sequencing of grammatical structures in the ESL syllabus. The current ESL syllabus is based on the assumption that some TL structures are universally simpler and therefore easier to learn than others. Syllabus designers who made this assumption did not base their notions of simplicity on second language acquisition research but rather on their intuitions about what was a simple grammatical structure and a complex grammatical structure. (cf Krashen (1982), McIntosh (1979) and Pienemann (1993). Krashen (1982) have for example argued that language lessons should be sequenced according to the practical needs of the learners rather than according to the structural simplicity. According to this view L2 learners who have acquired the full grammatical resources of their L1 should be exposed to the full grammatical resources of the TL which can support L2 communication. Lightbown points out that there is a need on,

"the insistence on practice of correct forms be replaced by a greater emphasis on providing learners with a variety of language in meaningful and motivating contexts"  (1985: 103)

It is necessary to investigate whether Kikuyu learners of English (and others in the ESL environment) who have acquired the grammatical structures of their L1 should be exposed to an ESL syllabus which is explicitly or implicitly based on the assumption of structural simplicity in which simpler structural language items are taught first, and those which are considered complex are taught last.
In conclusion we would like to point out that, as this study shows, there is an emerging usage of English which differs from the Standard English which has gained currency among the users of English in Kenya. Its status with respect to the learners' linguistic competence remains uninvestigated. The questions of its acceptability and its grammatically have not received adequate study. Besides, we are yet to define local standards of English proficiency which would be in harmony with the unique features of the Kenyan socio-cultural environment.

Included in this section is a list of the data of Non-Target-Like sentences which were culled from the written compositions of Kikuyu learners of English. The data is divided into two parts:

(i) Part One which is coded [P] comprises the Non-Target-like sentences which were generated from the learners in Standard Seven and Standard Eight Primary School Subjects.

(ii) Part Two which is coded [S] comprises non-target-like sentences which were culled from the written compositions of Form One and Form Two learners of English.

Each non-target-like sentence is accompanied by the linguistic description of the type of deviation in bracket where and appropriate abbreviation has been used. For example, [W.O.] is used for word order deviations, [T] is used for tenses, [Pron] is used for Pronoun deviations while [Neg] is used for deviations in Negation etc. Most Non-target-like constructions have more than one deviations. In instances where the origin of deviations can be traced to the learners First Language (L1) the abbreviation (LT) for language transfer, or [MTI] for mother tongue interference are used in instances for use of calques.
Some of the non-target-like sentences have been used as examples in Chapter Five, while others have been used to support analysis, explanations and elaboration of Data Analysis and Findings and Discussion of Findings in Chapter Six.

In Appendix, (ii) we include a transcribed sample of Oral Composition Data which is labelled Narrative 'A2. The distribution of non-target like constructions in the written composition data is relatively similar to that in the Oral composition data as the non-target-like sentences display typological similarities and linguistic characteristics.

The planning and production of written discourse constrains the learners to employ specific L2 communication strategies which differ from those in planning and production of oral discourse. The data shows that the spontaneity in the planning and production of oral discourse influenced the transfer of L1 cultural and linguistic patterns in English through nativization.

The following data has retained the spelling of the incorrectly spelt words which the informants used. Such incorrect spellings are significant in the ESL teaching/learning situation as future studies into the causes of spelling mistakes has the potential of yielding some interesting results.
When the two children's, Mwangi and Wambui went to one of their neighbour garden they saw mango tree with some ripe mangoes. (Number, CL)

When the two children reach where the mango tree was they both started asking each other will cribe the tree. (Tense, CL. Inter. MTI)

When Mwangi the tree he saw three mangoes which was far where he was so he decided reach the mangoes and he started going with the brach. (MTI., Tense, Number Cl, Phr, Prep.(WO))

When they reached there they saw Mwangi falling down and thy took her and her father carry her with her hands towards home. (MT1, Pronoun, Tense)

When Mwangi were with her mother her mother asked her where he was felling pain and her mother all body of is felling pain so her mother sent Wambuito the ship to buy some medicines to give her ro relive pain. (MTI, Number, Pronoun, Cl. Phr, Lexical)

The two children were standing on the mango tree and look the mango and when they were looking the boy told her sister to stand their and look a person. (MTI. Lex, Pron, Prep.)

She was starting crying because her sister was saying her brother was dead. (MTI, Tense, Aux.)

After getting that boy who was called Kamau fast did he told her sister who was called Njeri to stop crying (MTI, Pron.)

When they reached near his home his mother was in the back of the house and she was see a man was carrying a child and she was see her daughter Njeri. (MTI, Cl, Tense, Aux.)

One day when two children were play they were tried to play more and they decide to go back to they house. (MTI, Pron. Aux. Prep. Tense.)

When they were there they start asking each other how is go to climb the tree to pick the ripe mangos (MTI, Interr. Tense)

After a couple of minute the boy decide to climb the mango (Number, MTI)
13. When the boy climb to that direction the branch broken off  
(Tense, Number, Prep.)
14. She move some centimetre away from where she was standing  
on  
(Tense, Number, Prep.)
15. One day when two children went to harvest a mangoes there  
were boy and girl  
(Article, Number.)
16. We know that boys were given that talent for climbing the  
trees  
(Prep.)
17. The boy climb the tree safely and he reached where the ripe  
mangoes were. The boy catch the mangoes and start throwing  
down.  
(Pron. Tense, Cl. Prep.)
18. Her father came very quickly has he can and met her son is  
lying down eve he cannot speak matekly.  
(Modal, Tense, MTT)
19. There was a boy and his father they went to the garden to  
dig  
(Prep. Pron.)
20. When the boy reached there her father sat down and took the  
water.  
(Pron.)
21. He started drinking while her son was digging  
(MTI, Pron.)
22. When her father still digging he heard a shout  
(Aux.)
23. It was on Monday when Mr. mwangi told her son that the  
following day, they are going to the shamba for weeding but  
he told him he is not going to dig but collecting weed.  
(Article, Pron. Tense, Aux. Modal, Linkage)
24. As the boy start doing the job for while he was bit by a  
snake and so he woke up and he start going  
(Tense, Article, Cl.)
25. So he took he son to the hospital and he told the doctor the  
whole story and the doctor to him that then can not help him  
because they don't know that type of snake has bitten him  
(Cl. Tense, Prep. MTI., Lex. Neg.)
26. At was a very hot day  
(Prep.)
27. A father and his son was digging
   (Art. Number)

28. When the boy came back he get the water and sat down
    somewhere under the tree to get fresh air
   (Tense, Article MTI, Cl)

29. He told his son collect all things which are not necessary
    in their shamba
   (Pron. Art. Prep. Tense)

30. A big snake came out of those waste
    (Number)

31. His father knock it on the head and the snake dead
    (Tense, Pron.)

32. That man told her son to go and fetch some water at the
    river
   (Pron. Prep.)

33. The boy came back with a full jug of water
   (Word Order)

34. The boy done as that and his father continued dug
   (Tense)

35. All that they were digging and kept them all of
   (Word Order)

36. One day when the two mens were going in the garden
   (Number Prep. Cl.)

37. And he was fell down and the other men didn't not show
   (Negation, Aux, MTI)

38. When the other men see the other one was sle eping the men
    was going slowly and go where it was sleeping
   (Tense, Pron, Cl. Number, Prep.)

39. The men can getting him first aid after he was geting him
    the first aid he was lifting him and take him in the
    hospital
   (Aux. Modal, Tense, Prep)

40. One fine day the man wake up at the crack of a dawn
   (Tense, Article)

41. After he was weeding a small part of the garden he felt
    hungry and thirsty.
   (Adv. Adjunct, MTI)
42. When after a couple of minute he saw her son coming with the calabash on the head and that calabash was full of sour milk.
(Number, Pronoun, Linkage Cl. Article)

43. When the rest so that he could be able to drink her son help him to continue digging (Tense, Cl.)

44. Before her father was finished he was very happy of their garden was clean and tidy (MTI, Aux.)

45. When he was there he was very happy because her father was given him a person to go all over the garden (Aux. Tense. Pron. Cl)

46. After he reached where the snake was resting the snake jumbed to him and bite one of the leg.
(Number, Cl. Tense.)

47. When her father heard that he started finding that snake and he saw it and he cut it two times with a jembe.
(Cl. MTI, Pron.)

48. The boy, was walking around their house with her sister (Pro )

49. He saw a ripe fruits and decided to picked them (Article, Number, Tense)

50. Her sister came hurry and she asked Mutua what are you doing (Interr. Prep. Article)

51. When they were there Mutua show her sister that fruits. And her sister felt as if she was eating (Pron. Cl. Number)

52. The boy climbed a tree so the he can pick that fruits (Number, Article)

53. When he was nearly to reach to the fruits the branch was broken (Prep.)

54. And he fall down like a stone (MTI, Tense)

55. She started shouting loudly so that man he can ran faster (Cl. Tense, Modal)

56. The man take the boy and started a journey to the home where the boy come from (Tense, Art. Prep. MTI)
P57. When they reach at home her mother started shouting (Prep. MTI)

P58. I didn't answered for him after calling me (Neg. Tense, Prep.)

P59. My sister run after me and told me that my father is calling me (Aux. MTI, Tense)

P60. I told her I must got to find for some fruit my sister go back and told him what I have said and my father said "live him" (Tense, MTI, Prep. Aux.)

P61. I climb on the tree and when I was looking the branchs with the ripe fruits , I stepped on a dry branch and the branch broken (Prep. MTI, Tense)

P62. My sister told him the whole stoly my father told me that he called me and I refuse to go and he told me that is the aim of felling down and so my father shake my hand and wake me up. (MTI, Tense Cl. Aux.)

P63. One day there was a boy called Atieno and his sister called Elisha (MTI)

P64. One day they went nearer to a mango tree to see what time they can harvest (MTI, Modal, Tense)

P65. Her sister told him to climb-up a tree to look if the mangoes is ripen (Tense, MTI, Prep. Aux.)

P66. Her sister become very lugubrious because her brother had refused to pick him a mango (Pron. MTI)

P67. After a couple of a minute he reached up on a tree (Article, Number, Prep)

P68. He could not took some for Elisha (Modal, Tense)

P69. They started her journey through to the hospital (MTI, Prep, Pron)

P70. Her father told him that how silly are you as a dog isn't me I told you to climb a tree and not care (Negation, Tense, MTI, Article)
P71. Mangori left from school to home (Prep, MTI)

P72. When the two are on the way to home the two saw an orange tree with ripe oranges (Tense, Aux, Pron, Prep)

P73. Mangori told her sister to stolen the oranges, then NyamboKe did not refused to go and join his brother (Tense, Linkage, MTI, Negation)

P74. After a couple of minute Mangori climb the tree and started picking the oranges and thrown it to her (MTI, Tense, Number, Pron)

P75. When Nyamboke was looking side to side she saw a man coming slowly by slowly towards her (MTI, Prep)

P76. She called his brother and asked him there is a somebody towards us (Tense, Inter, Pron)

P77. When the man arrived there Nyamboke asked him his name then the man replied that his name is called Mr. Kimanjuru (Interr, Tense, MTI)

P78. When am eating some of the mangoes I saw some people coming (Pron, Tense)

P79. I will sent us to the shop (Pron, Tense, Modal, Number)

P80. We refused both of us and went away running that mother could not see us (MTI, Word order, Cl)

P81. When we were on the way we a mango tree we try what to do to pick the mangoes, I told my brother it looks very niece (Tense, MTI, Number)

P82. My brother to climbed on and I look at him to see whether there were people coming (Prep, MTI)

P83. I told my brother with soft sound that some one cannot hear, some people coming. A couple of minutes my brother felt down because of afraid (MTI, Neg, Tense, Prep, Cl)

P84. The asked me where is our home (Interr, Tense)
He told me to show the way of home (Pron, Prep)

S443. This can led to accumulation of carbon monoxide. [Modal].

S444. Although scientist have proved that nicotine is a vitamin, when inhaled through smoking it become harmful [number, tense, morpheme].
I am a student who is interested in past events.

After I undergo the course and pass, I would like to take the career of doctrine.

Although doctors deal with people who are unfit as far as health is concerned, doctors play a very great role.

This is because doctors do not play their role as much as they should. A lot of deaths would be occurring day after day.

Doctrine is beneficial in that one is able to meet a lot of people.

These organisms are the ones that cause diseases.

One has a target which he wants to achieve.

On my opinion, this work is more than enjoyment.

In this, I want that the work is not tiresome. Because one does not usually use his energy like digging or any other work which energy is needed.

Other advantages over the work are that one enjoys himself when crossing valleys.

Engineering has become a very beneficial career in nowadays.

That's why I choose to be my future career because many people find it difficult to deal with the materials used to deal with this area.

If you want to build a house or to start constructing a new road for personal use, you may plan it yourself instead of finding an engineer to do it.

I would select a job career of salesman.

Witness of many people who choose a career job of salesman succeeding in their lives because it is a well-earning job which is not too tiresome because what is only required to a salesman is the approachment to customers.
Another reason is because nowadays people are relaying mostly on business [lexical].

The scarcity of land is problem which will affect those with career of farming [LT, clause, prepositional, article].

In salesman one I will be able to lead a successful life [W.O, prepositional].

The pollution of air is done by many ways [prepositional].

In factories we have many these which uses fuel, coal gas and electric power. [RC].

This is why some people who have finished the secondary no where to be employed starts to do bad things [determiner, clause, number, tense, lexical, W.O].

The other reason is being a lawyer to like being a tourist [LT, prepositional, tense].

Also these industries when are being worked on they produce smoke which is filled with a lot of bad chemicals. [Clause, lexical].

Also these industries when are being worked on they produce smoke which is filled with a lot of bad chemicals. [Determiner, lexical, LT, RC].

Pollution of air is very high especially to those that are popular for the making of dangerous weapons [prepositional, lexical].

If we look a country like japan where many people are with so much defects like being born blind. [LT, lexical, Tense, Countable, number, determiner].

There was war and still they have the effect to young ones who are even born today [LT, adverbial, lexical, prepositional].

These harmful germs that are contained penetrate through our nostrils [lexical, prepositional].

One get very many chances to rest [tense, morphological].

When I will see myself working with one of the hospitals in this world [tense, lexical, LT, Prepositional RC, subordination].
If my dreams comes true an I find myself being a doctor [lexical, number, LT].

When one inhales these gases some of it is very dangerous [number, pronoun ref, clause R.W.O, subordination].

This means that after several years of taking these harmful gases, one finally up in the grave [number ref, lexical].

Another enemy of human is viruses [lexical].

Viruses are very dangerous since they are not treated once they enter the body [tense, lexical, LT].

A good student always look forward and decides on what career he would prefer to perform [lexical, number concord].

One should be a hardworking and so careful because he is treating somebody and may lead to a cause of death. [Clause, article, tense, lexical, LT].
